1.0 Document Information

The **warehou** database has been constructed primarily to facilitate reporting. This document describes **warehou**'s Catch Effort base *fields* and *views*; the *event* concept; and the *keys* used to link views.

This document is adapted from part 2 in a series covering aspects of the Ministry of Fisheries Catch Effort system.

This document is not intended to be a comprehensive guide to the database but has been written as basic background material for report writers. A solid foundation in database concepts, and a basic understanding of the business of commercial fishing are assumed.

It is possible that factual errors will exist within this document. Please report any such factual errors that you find to the Ministry of Fisheries Research Data and Reporting Group so that we may correct these in subsequent versions.

Further information that is useful when interpreting New Zealand's Catch Effort data is available on the Ministry of Fisheries '**Catch Effort Reference Library**' CD. A copy of the CD can be obtained from the Research Data and Reporting Team Leader on phone: 04 8194714 or email rdm@fish.govt.nz

2.0 The Information Provided by the Fishers

The Catch Effort system stores catch, effort, landings, production and environment information provided to the Ministry of Fisheries by commercial fishers.

- Estimated catch data are rough estimates of the catch (kg of each species) made by fishers as they fish. For example, a fisher may haul a line onboard and visually estimate that they have caught 300 kg of Bluenose, 50 kg of Ling and 25 kg of Spiny Dogfish.
- Effort data summarise the amount of effort that a fisher/vessel put into catching fish; specify what method the fisher was using; and what species they were targeting. For example, a vessel mid-water trawling for Hoki towed a 50 metre wide net for 3 hours at a speed of 4 knots.
- Landing data summarises the actual quantity of fish landed at a wharf, retained at the end of the trip or transferred to another vessel at sea. Landings data are considerably more accurate than estimated catch data.
- Production data summarises the estimated quantity of fish processed onboard a vessel during a day. This will usually be more accurate than estimated catch but less accurate than actual landings.
- Environment data summarises sea and fishing activity, depth, wind speed, cloud conditions, and water temperature at the time of fishing.

The information received from fishers is recorded on one of the following forms:

CELR - Catch Effort Landing Return (called CEL within the database)

Records estimated catch, effort and actual landings for approximately 30 different fishing methods. Because so many different methods of fishing are covered, many parts of the form are labelled in a generic manner. The fishers superimpose one of seven cardboard templates over the form depending on the actual fishing method used. These templates specify what information a fisher should enter in each field on the form (refer to the “CELR” table in Chapter 5.0 Meanings of Effort Variables) for a list of effort fields that are collected for each method type). Fishers that fill in a CELR do not fill in any other type of form for the same fishing. One form is used for each trip (unless multiple pages are needed). Over the years small changes have been made to the form. In 2008 the CELR form had a new field “Non-fish / Protected species catch? (Y/N)” added.

TCEPR - Trawl Catch Effort Processing Return (called TCP within the database)

Records estimated catch, effort, processing and environment data for deep sea trawlers. Deep sea trawlers are defined as vessels that are over 28 metres in overall length. Fishers that carry out trawling on vessels less than 28 metres in overall length are required to complete either a CELR using the trawl template or the TCER form. The TCEPR form requires more detail than CELR trawl forms. As no landing data is recorded, any fisher that fills in a TCEPR must also fill in a CLR. One form is used for each day (unless multiple pages are needed). On 01 October 2008 the field “Non-fish / Protected species catch? (Y/N)” was added.

TCER – Trawl Catch Effort Return (called TCE within the database)

Records estimated catch and effort data for trawlers that are between 6m and 28m in overall length. Fishers that carry out trawling on vessels less than 6 meters in length or have a multiple method exemption are required to complete a CELR using the trawl template, and larger trawl vessels are required to complete a TCEPR. As no landing data is recorded, any fisher that fills in a TCER must also fill in a CLR. This form was introduced on 01 October 2007. Prior to this the information was entered on a CELR form.

TLCER - Tuna Long - lining Catch Effort Return (called TUN within the database)

Records effort, processing and environment data for surface long liners targeting tuna or swordfish. Records more detail than the CELR form. Estimated catch is not recorded because processing data may be used for this purpose. As no landing data is recorded, any fisher that fills in a TLCER must also fill in a CLR. One form is used for each long line set (commonly 1 per day). Note: there is four different versions of this form (1991, 2001, 2003 (March/April) & 2008). Refer to the “Calendar of Changes” on the Catch Effort Reference Library CD for further information. On 01 October 2008 the field “Non-fish / Protected species catch? (Y/N)” was added.

SJCER - Squid Jigging Catch Effort Return (called SJC within the database)

Records effort, processing and environment data for squid jiggers. Estimated catch is not recorded because processing data may be used for this purpose. As no landing data is recorded,

any fisher that fills in a SJCER must also fill in a CLR. One form is used for each day. On 01 October 2008 the field “Non-fish / Protected species catch? (Y/N)” was added.

LCER – Lining Catch, Effort Return (called LCE within the database)

Records effort and estimated catch data for vessels greater than 28 metres in overall length where the method of fishing is bottom longlining, surface longlining (targeting species other than tuna), or trot lining. This is a daily form that was introduced in January 2004. This information was previously recorded on CELR forms. Fishers that carry out bottom longlining or trot lining on smaller vessels are required to complete either a CELR using the lining template or the LTCER form, while fishers that carry out surface longlining (targeting tuna or swordfish) are required to complete a TLCER. As no landing data is recorded, any fisher that fills in a LCER must also fill in a CLR at the end of each trip. On 01 October 2008 the field “Non-fish / Protected species catch? (Y/N)” was added.

LTCER – Lining Trip Catch, Effort Return (called LTC within the database)

Records effort and estimated catch data for vessels that are between 6m and 28m in overall length where the method of fishing is bottom longlining, surface longlining (targeting species other than tuna), or trot lining. This form was introduced on the 01 October 2007. This information was previously recorded on CELR forms. Fishers that carry out bottom longlining or trot lining from vessels less than 6 meters, or who have a multiple method exemption are required to complete a CELR using the lining template, while fishers that carry out surface longlining (targeting tuna or swordfish) are required to complete a TLCER. As no landing data is recorded, any fisher that fills in a LTCER must also fill in a CLR at the end of each trip.

NCELR – Netting Catch, Effort and Landing Return (called NCE within the database)

Records estimated catch, effort and landing information for those fishing using the set netting (SN), inshore drift netting (DN) or pair set netting (PSN) methods using a vessel 6 metres or more in overall length. This form was introduced on 01 October 2006. Prior to this the information was entered on a CELR form.

CLR - Catch Landing Return (called CLR within the database)

Records actual landings data for a vessel. Only filled in if a fisher also filled in TCEPR, TCER, TLCER, LCER, LTCER, HS LCER, HS TCER, HS TLCER or SJCER forms. One form is used for each trip (unless multiple pages are needed).

ECER - Freshwater Eel Catch Effort Return (called ECE within the database)

Records estimated catch and effort information from those fishing for freshwater eels (EEU, LFE and SFE species). This is a monthly form that was introduced on 01 October 2001. Prior to this, fresh - water eel data was recorded on CELR forms (refer to the “Calendar of Changes” on the Catch Effort Reference Library CD for further information). As no landing data is recorded, any fisher that fills in a ECER must also fill in a ECLR.

ECLR – Freshwater Eel Catch Landing Return (called ECL within the database)

Records actual landings data for freshwater eels and eel by-catch species. Only filled in if a fisher also filled in ECER form. This is a monthly form that was introduced on 01 October 2001. Prior to this, freshwater eel landing data was recorded on CELR forms.

PCELR – Paua Catch, Effort and Landing Return (called PCE within the database)

Records estimated catch, effort and landing information from those fishing for Paua (PAA and PAI species). This is a daily form that was introduced on 01 October 2001. Prior to this, Paua information was recorded on CELR forms in a different manner.

HS CELR – High Seas Catch Effort & Landing Return (called HCE within the database)

Records estimated catch, effort and actual landings for vessels that have fished outside the NZ EEZ area. The cardboard templates used for the CELR form are also used with this form to cater for the wide range of fishing methods. This form was introduced on 01 October 2001. Prior to this, all extra territorial information was recorded on standard CELR forms.

HS TCER – High Seas Trawl Catch Effort Return (called HTC within the database)

Records estimated catch, effort and environment data for vessels that have trawled outside the NZ EEZ area. This form does not require processing details unlike the TCEPR. This form was introduced on 01 October 2001. Prior to this, all extra territorial information was recorded on TCEPR forms. As no landing data is recorded, any fisher that fills in a HSTCER must also fill in a CLR if they are landing catch into NZ.

HS TLCER – High Seas Tuna Longlining Catch Effort Return (called HTU within the database)

Records effort, processing and environment data for surface long liners targeting tuna outside the NZ EEZ area. This form was introduced on 01 October 2001. Prior to this, all extra territorial information was recorded on standard TLCER forms. As no landing data is recorded, any fisher that fills in a HS TLCER must also fill in a CLR if they are landing catch into NZ.
Note: there is also a 2003 version of this form. Refer to the “Calendar of Changes” on the Catch Effort Reference Library CD for further information.

HS SJCER – High Seas Squid Jigging Catch, Effort Return

Records effort, processing and environment data for squid jiggers that have fished outside the NZ EEZ area. This form was introduced on 01 October 2001. Prior to this, all extra territorial information was recorded on standard SJCER forms. As no landing data is recorded, any fisher that fills in a HS SJCER must also fill in a CLR if they are landing catch into NZ.
NOTE: This form is currently not used in practise, as there are no NZ squid jigging vessels fishing outside the NZ EEZ.

HS LCER – High Seas Lining Catch, Effort Return (called HLC within the database)

Records effort and estimated catch data for vessels greater than 28 metres in overall length fishing outside the NZ EEZ where the method of fishing is bottom longlining, surface longlining (targeting species other than tuna), or trot lining. This is a daily form that was introduced in January 2004. This information was previously recorded on HS CELR forms.

Fishers that carry out bottom longlining or trot lining on smaller vessels are required to complete a HS CELR using the lining template, while fishers that carry out surface longlining (targeting tuna) are required to complete a HS TLCER. As no landing data is recorded, any fisher that fills in a HS LCER must also fill in a CLR if they are landing catch into NZ at the end of the trip.

NFPSCR – Non-fish / Protected Species Catch Return (called NPC within the database)

The NPC form was introduced on 01 October 2008 to record the estimated catch of non-fish and/or protected species caught during commercial fishing. On 01 October 2008 the commercial fishing forms, CEL, SJC, TCP, LCE and TUN had a new field “Non-fish / Protected species catch (Y/N)” added to them. The TCE, LTC and NCE forms already had this tick box. The NPC form is only required to be completed when this field has been entered with ‘Y’.

Earlier form types

This document describes the situation for the current generation of forms filled in by fishers. Some of these forms have been in use since 1990 or 1991 while others are more recent. The earlier generations of forms stored similar but not identical information. Sometimes more information was stored, sometimes less. There are many fields in the **warehou** database which store information only covering a particular time period (relating to a generation of forms), and outside this period contain NULL values.

Refer to **Appendix 1** for a copy of the current catch effort returns with information about the associated fields.

Copies of some of the older catch effort returns versions of returns are available in **Appendix 2** or in the Catch Effort Reference Library CD.

3.0 The Catch Effort System

The Catch Effort system stores the information recorded on CELR, TCEPR, TCER, TLCER, SJCER, NCELR, CLR, PCELR, ECER, ECLR, LCER, LTCER, NFPSCR, High Seas forms and their predecessors. Approximately 400,000 forms are entered into the system each year. For reasons which are explained in section 3.3, multiple versions exist for many of these forms.

This information is used primarily for fisheries resource management and law enforcement purposes.

The Catch Effort information is stored in the following databases:

- The **form** database (on Surimi server) accepts data entry, checks for errors and passes all but fundamentally flawed records across to the **catcheff** database. Individual fields that are clearly incorrect may also be withheld.
- The **catcheff** (on Surimi server) database stores the data taken from the forms provided by fishers.
- The **ref** and **corporat** databases store relatively static reference information such as valid species codes (three letters), fishing methods (currently up to 3 letters but was a numeric code in the past), vessel names and characteristics, and details relating to each fisher.
- The **warehou** database (on Moby server) is essentially a copy, taken daily, of the **catcheff** database, along with selected data from the form, ref, corporat and a range of other databases.

3.1 The Warehou Database

Warehou is structured in a similar fashion to **catcheff**. One major difference being that processing and landing data, which is stored in the one table named **specprod_act** in **catcheff**, is broken down into four separate tables in **warehou**. These tables are;

- **ce_processed_catch**: containing on board processing data (TCEPRs, SJCERs and TLCERs);
- **ce_landings**: containing landing and transhipping data (CELRs, CLRs, ECLRs, PCELRs, NCELRs, HS CELRs);
- **ce_tuna_individual_catch** (historical) containing Southern Bluefin Tuna processed weights (TLCERs and HS TLCERs prior to April 2003); and
- **ce_squid_tally**: containing squid tray tally data (SJCERs and HS SJCERs).

Warehou contains data from nil returns, previously not available in **catcheff**. A nil return confirms that a fishing trip did not take place during a calendar month. All clients are required to provide a nil return for each vessel under their operation for months where there was no fishing activity.

Warehou incorporates person and vessel fields and tables from the **ref** and **corporat** databases.

3.2 The Concept of an Event

Central to the Catch Effort system is the concept of an event. An event is a specific temporal occurrence for a vessel or fisher. As such an event will always have an associated vessel and/or fisher identifier, a start time, and will frequently have an end time and a location.

The Catch Effort system defines 4 types of events:

- **Fishing events** (operational event type = “F”). Are associated with estimated catch and effort data. For example, one *set* or *tow* and all its effort data constitutes a fishing event.
- **Production events** (operational event type = “P”). Are associated with processing and actual landings data¹.
- **Environmental events** (operational event type = “E”). Are associated with environmental and vessel activity data. Environmental records are made on a daily basis.
- **Trip events** (operational event type = “T”). Associates all of the fishing events from a single trip with its landing (processing event type) events. This means that a **trip event** is made up of all the **fishing events**, **processing events** and **environmental events** recorded by a vessel and fisher during a single fishing trip.

All of this data is stored in the **ce_event** view. The **ce_event** view is at the centre of all relationships within the **warehou** databases.

Despite all event data being stored in the **ce_event** view, it is considerably easier to understand the relationships between views within the database if the **ce_event** view is conceptualised as being 4 separate views, one for each type of event.

This principal is illustrated in diagram 1 (Relationships Between Views in the Warehou Database) and diagram 2 (Indexes in the Warehou Database).

3.3 Versions of Forms

For law enforcement purposes there is a business requirement that the Catch Effort system store exactly the data that was submitted to the Ministry by the fishers. If the fisher made an error then this must be retained in the data.

For fisheries resource management purposes there is a business requirement that the Catch Effort system store the best information available. If the fisher makes an error, which FishServe is entitled to interpret, then the data should be corrected.

These different requirements have resulted in a need to store multiple versions of a single form. Because fishers frequently make mistakes in the forms that they return to the Ministry it is very common for two versions of a single form to exist on the Catch Effort system.

The “literal” version of a form contains the latest version of the information that a fisher provided to the Ministry.

¹ However, if a new form is required to accommodate all the fish being processed or landed then the new form constitutes a new *processing event* within the *trip event*.

The “interpreted” version of a form should contain at least 1 field of data that has been changed from the literal version. A FishServe Information Officer is entitled to make some interpretations without contacting the fisher. For example, if a fisher wrote “snapper” this could be interpreted to the species code “SNA”.

Because scientists often disagree on how to interpret an erroneous item of data there was also a possible need for different people be able to interpret data in different ways. To cope with this requirement provision was made for “Research” and “Personal” versions to be created although this has not been implemented.

To prevent a query from double counting multiple versions of the same form it is essential that the user specify whether they wish to use the literal, interpreted or research version of the form.

3.4 The Concept of a Trip

Vessels frequently undertake fishing trips that last for more than one day. A mechanism for associating actual landings data with the processing, estimated catch, effort and environment data that occurred during the trip is therefore needed.

The start and end trip dates provided by the fisher on CLR, NCELR and CELR forms define the trips done by a vessel. Effort forms such as TCEPR forms can also be associated with a trip. A system generated number, a **trip** key, is assigned to all forms that are provided by that vessel between the start and end date of the trip. The same trip key is assigned to all events recorded on forms where there is an overlap in trip dates for a particular vessel.

A trip may be terminated by either landing or transshipping. At any given time a vessel can only be participating in one trip.

It is important to be aware that fisher errors on the forms (for example incorrect dates) can result in some events being incorrectly grouped together as the same trip.

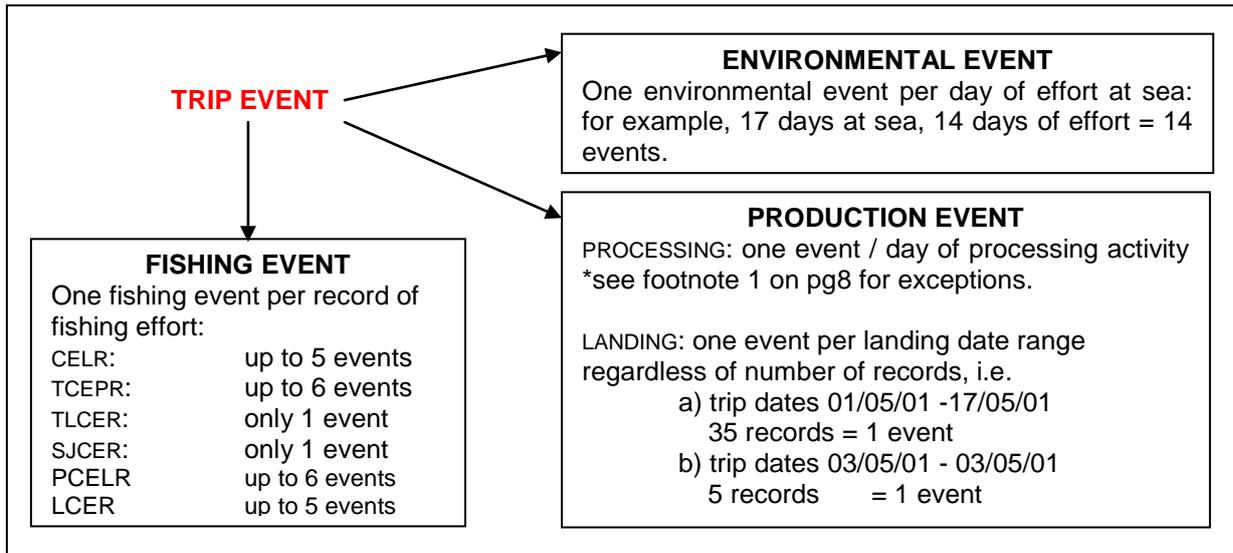

Note: PCE, ECE and ECL forms do not have trip keys as these are daily or monthly forms that are not trip based. Initially this was also the case for High Seas forms, as there is often no landing return to link to (i.e. when fish is landed outside of New Zealand). This was later changed and trip keys are now generated for High Seas forms when possible.

3.5 Trip Breakdown

Every event record has a unique identifier attached to it so that events can be linked together. For example, *ce_fishing_event* can be linked to *ce_estimated_subcatch* using the event_key.

A trip event identifies all the fishing, processing and environmental events that occur during a single trip (whether it is one day or several weeks). Below is a basic breakdown of what makes a trip event.

Relationship between events

For example:

CELR - The form below shows the following:

Trip Dates: 01/06/01 - 02/06/01
 No. of days fishing: 2 effort days (2 sets/day)
 Landing Date: 03/06/01

This results in 1 trip event, 4 fishing events; 1 production(landing) event*;
 (no environmental data on CELRs)

Catch, Effort and Landing Return

Trip Data

First day of trip	Last day of trip if different from first day of trip	Landing date	Vessel registration number	Vessel name	Vessel registration number of other vessel (if pair fishing)	Point of landing	Page 1 of 1
01/06/01	02/06/01	03/06/01	69054	VIKING KING		AUCKLAND	

Catch/Effort Data

Day and month	Method code	Position Lat Long or Seat area	Time hours mins	Effort data				For each change of day, method or stat area, enter estimated greenweight catch by species in order of quantity						No: A 2172668
				A	B	C	D	target species Total (kg)	Species code Weight (kg)	Species code Weight (kg)	Species code Weight (kg)	Species code Weight (kg)	Species code Weight (kg)	
01/06	BLL	008		3000	6			SNA 800	SNA 600	TRE 100	RSN 100			
01/06	BLL	007		500	1			SNA 200	SNA 100	TRE 100				
02/06	CP	008		25	5			BCO 2500	BCO 2500					
02/06	CP	007		5	1			BCO 1000	BCO 1000					

Catch Landing Data

Fishstock (Species/Area)	Landed state	Containers			Destination		Greenweight (kilograms)	Purchase tax invoice number from LFR
		Number	Type	Content weight	Type	LFR no. or vessel reg no.		
BCO 1	FIL	51	TUB	30	L	12345	3489.20	99999
SNA 1	GRE	21	BIN	33	L	12345	701.41	99999
TRE 1	GRE	6	BIN	30	L	12345	198.53	99999

Start a new sheet for each landing. It is an offence to fail to complete this return or supply false information or make any material omission.

Permit holder's name	Permit holder's client no.	Signature of master or permit holder	Date signed
JOHN CITIZEN	8459894	J. B. 10/9/01	03/06/01

General Guide to linking between event types

Event View Four Conceptual Divisions				
	Fishing	Production	Environment	Trip
LINK: event_key ↑ ↓	ce_fishing_event	ce_squid_tally	ce_environment_data	ce_trip_event
	ce_estimated_subcatch	ce_tuna_individual_ca tch (historical)	ce_vessel_log_data	
	ce_bait	ce_processed_catch		
	ce_event_assoc_object	ce_landing		
L	←	LINK: dcf_key (if forms are different e.g. CLR linked to TCP use trip)		→

Remember:

These are general rules of application and there are some exceptions.

Linking between ‘conceptual’ events with dcf_key will only work if the form number and type are the same. So if you have a CLR that you are trying to link to a TCP, SJC or TUN you would have to use trip key.

Confirm each link before entering code.

All links must include version_seqno - or you’ll get double counting through multiple versions of forms. This means you must also specify which version of the form you want to extract (literal, interpreted, legal, personal, research): normally interp_yn =“Y”

4.0 Views within the Warehou Database

There are 11 core views in the **warehou** database. Below is a description of these views. Refer to Diagram 1 for an illustration of how these views relate to the event table.

- **ce_event** - Stores information on the timing and location of an event that occurred to a particular vessel or fisher.
- **ce_fishing_event** - Stores effort and some environment data relating to a particular event of type “fishing”.
- **ce_estimated_subcatch** - Stores estimated catch data relating to a particular event of type “fishing”.
- **ce_landing** - Stores landings data and data on the location of landing or transshipping relating to a particular event of type “production” recorded on a CLR, CELR, PCELR, NCELR, HS CELR or ECLR.
- **ce_processed_catch** - Stores production data relating to a particular event of type “production” recorded on a TCEPR, TLCER, SJCER, HS TLCER, HS SJCER or HS TCER.
- **ce_squid_tally** - Stores squid tray tally data relating to a particular event of type “production” recorded on a SJCER or HS SJCER.
- **ce_tuna_individual_catch** - Stores historical Southern Bluefin Tuna individual processed weight data relating to a particular event of type “production”. This information was recorded on older versions of the TLCER form but is no longer collected on the latest versions of this form (2003 & 2008 versions).
- **ce_environment_data** - Stores environment data relating to a particular event of type “environment”.
- **ce_vessel_log_data** - Stores vessel activity data relating to a particular event of type “environment”.
- **ce_trip_event** - Stores trip duration data relating to a particular event of type trip based on what was originally recorded on the catch effort return. Note: it is recommended that the derived trip details are used from the trip_details table rather than the original form based data in this table.
- **ce_trip_details** – Stores the main details relating to a trip based on derived trip data.

There are 2 other seldom used views (**ce_bait** and **ce_event_assoc_object**) which store data on the bait used (1990 and 2003 versions of TLCER forms only) and the 2nd vessel in pair fishing (CELR, TCER or TCEPR forms only) respectively.

Each of the 11 core views has fields storing vessel and person/organisation identifiers. These fields have referential integrity checks imposed upon them and must have an equivalent identifier in the **vessel_specification** and **person_organisation** views, which reside in the **corporat** and **ref** databases respectively.

The tables **vessel_specification** and **person_organisation** are replicated in **warehou** and selected fields from these tables have been added to the core views. The replicated fields are detailed in the field descriptions in section 4.4.

There are further views, which store lists of valid values for various fields in the other databases views.

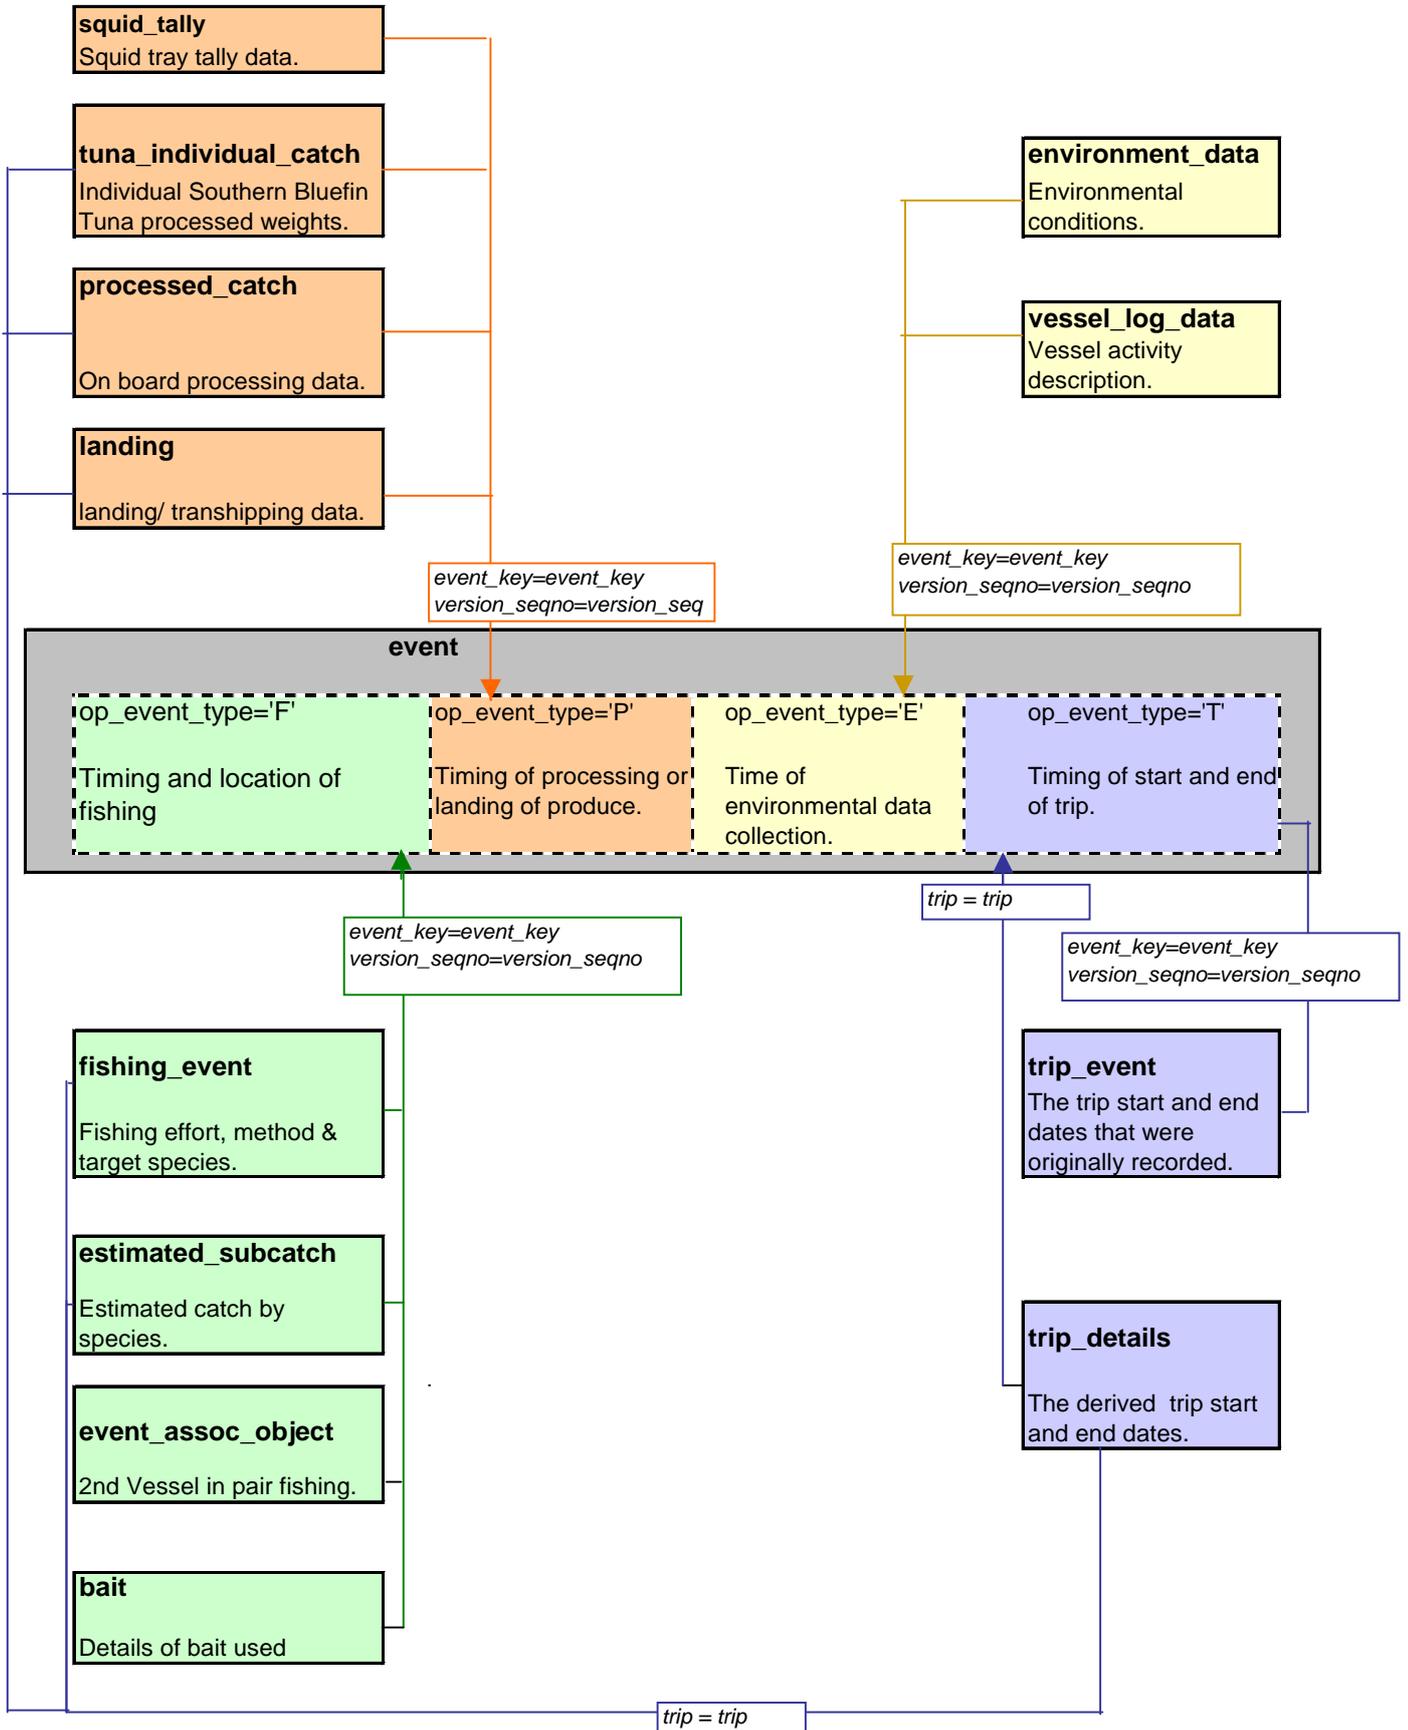

4.1 External Access to Warehou

Data is made available to clients external to the Ministry (such as NIWA) through the use of views that work as a filter on the core views. These views have the same name as the core views but are prefixed with “x_”, e.g. the view **ce_landing** when accessed by an external client is referred to as **x_ce_landing**.

The external views do not allow access to any vessel or client identifying data and store latitude and longitude data truncated to 1/10th of a degree only.

Diagram 1 illustrates the relationships between core views in the **warehou** database.

Diagram 1: Relationships between views in the warehou database

4.2 The Keys used to Link Views

The keys commonly used to link views in the **warehou** database are described below:

dcf_key + version_seqno - Dcf_key is a system generated number which uniquely identifies every form.

Multiple pages that are used for a trip will have separate dcf_keys. Version_seqno identifies which version of a particular form a record on the database relates to. The “literal” version of a form always has a **version_seqno** of 1. Because multiple versions of a form can exist on the database **dcf_key** must be combined with **version_seqno** to provide a key uniquely identifying a particular version of a particular form.

Dcf_key + version_seqno should be used when retrieving information from a form that relates to more than 1 type of event.

event_key + version_seqno - Each form can have many events recorded on it. As an example a single TCEPR form can have 1 environment event, 1 processing event and up to 6 fishing events associated with it. Event_key is a system generated number used to identify a particular event, (of type fishing, production, environment or trip), recorded on a particular form. Because multiple versions of a form can exist on the database **event_key** must be combined with **version_seqno** to provide a key uniquely identifying a particular version of a particular event on a particular form.

Event_key + version_seqno should be used when retrieving information from a form that relates to 1 type of event.

Note: If a new form is required to accommodate all the fish being processed or landed for a single trip then the new form constitutes a new **processing event (or landing event)** within the **trip event** i.e. the processing/landing event will be different for each form that is used for a trip.

vessel_key - A system generated number used to uniquely identify a particular vessel.

client_key - A system generated number used to uniquely identify a particular person or organisation.

The client and vessel keys are consistent over time i.e. the same vessel key will always represent the same vessel.

4.3 The Indexes within the Warehou Database

Diagram 2 shows the indexes on the core views in the **warehou** database. Due to space constraints the diagram often only shows the first part of multi-part indexes.

This diagram also shows the keys that should be used to link views.

For example - The table **ce_estimated_subcatch** can be linked to **ce_fishing_event** or **ce_event** using **event_key** and **version_seqno**. Events of different types belonging to the same form can be linked using **dcf_key** and **version_seqno**.

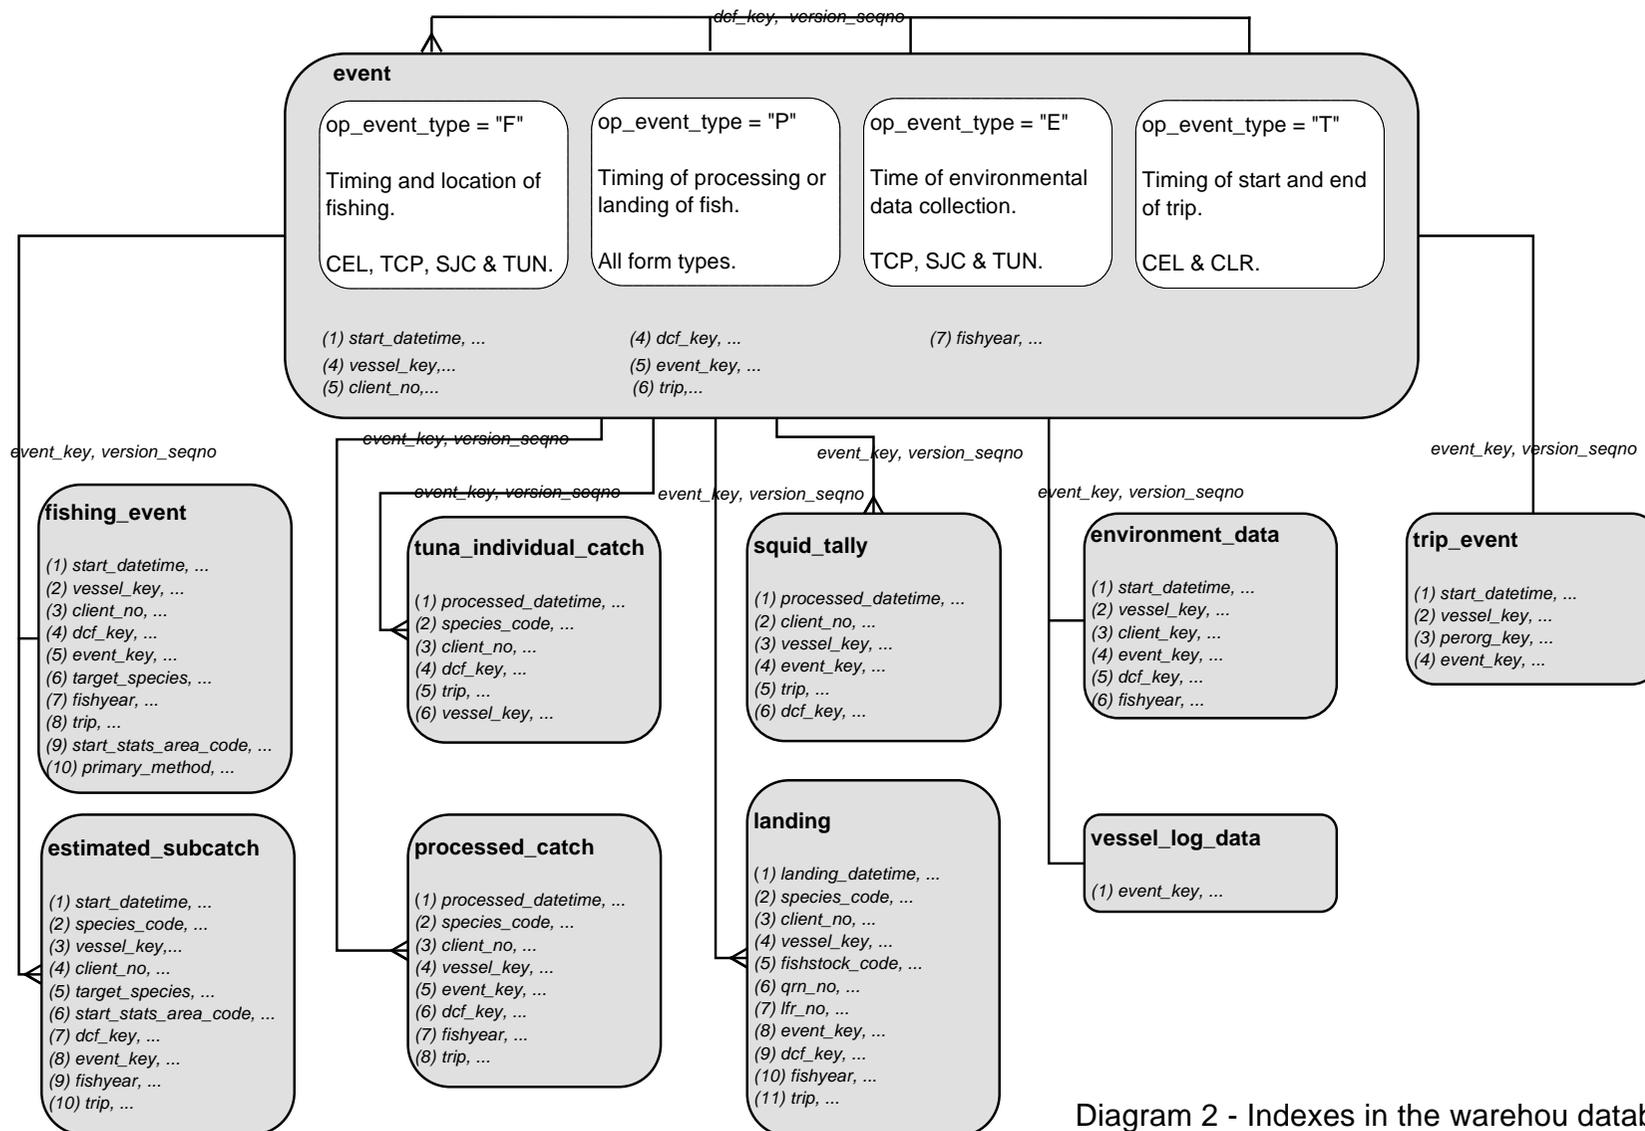

Diagram 2 - Indexes in the warehou database

4.4 The Fields in the Warehou Database

Some fields that are available in the **catcheff** core views are not available in **warehou** as they are not considered necessary for reporting.

To increase the performance of queries, many of the most frequently used fields are duplicated across the 11 core views.

Fields that have an historical reason for existing, but no longer store meaningful data, are marked as “Not used” in the comments column.

Fields which are the first part of an index are marked * in the field column.

Fields that are available in the external views are marked 4 in the Ext column, 8 means not available in external views.

A full description of the contents of each field in the 11 core views, plus **ce_bait**, **ce_event_assoc_object**, **ce_npc_fishing_event** and **ce_npc_estimated subcatch** follows :

Mfish View Name: **ce_event**

External View Name: **x_ce_event**

Description: Stores information on the timing and location of an event that occurred to a particular vessel or fisher.

Field	Ext	Usage	Comments	Field Type
event_key *	4	System generated number identifying a single fishing, production, environmental or trip event.	Unique key when combined with version_seqno.	keys
version_seqno	4	System generated number identifying the version of a single fishing, production, environmental or trip event.	Unique key when combined with event_key.	seqno
start_datetime *	4	The start date & time for an event. Note: the start date for an event of type "T" is a derived date that is created when the trip key is generated.	Important to select an op_event type	datetime
end_datetime	4	The end date & time for an event. Note the end date for an event of type "T" is a derived date that is created when the trip key is generated.	Important to select an op_event type	datetime
event_type	4	Used when linking catch effort data with that from external systems.	Not used in reporting.	type
confidence_scale	4	Confidence in forms data.	No longer used.	code
event_confidence_scale	4	Confidence in events data.	No longer used.	code
start_latitude	8	Decimalised latitude of start of event.		lat
start_longitude	8	Decimalised longitude of start of event.		long
end_latitude	8	Decimalised latitude of end of event.		lat
end_longitude	8	Decimalised longitude of end of event.		long
display_start_latitude	8	Latitude of start of event in degrees and minutes.		clat
display_start_longitude	8	Longitude of start of event in degrees and minutes..		clong
display_end_latitude	8	Latitude of end of event in degrees and minutes..		clat
display_end_longitude	8	Longitude of end of event in degrees and minutes..		clong
trunc_start_lat	4	Decimalised latitude of start of event truncated to 1/10 th of a degree.		numeric (4,1)
trunc_start_long	4	Decimalised longitude of start of event truncated to 1/10 th of a degree.		numeric (5,1)
trunc_end_lat	4	Decimalised latitude of end of event truncated to 1/10 th of a degree.		numeric (4,1)
trunc_end_long	4	Decimalised longitude of end of event truncated to 1/10 th of a degree.		numeric (5,1)
trunc_disp_start_lat	4	Latitude of start of event truncated to 1/10 th of a degree reported in minutes.		varchar (6)
trunc_disp_start_long	4	Longitude of start of event truncated to 1/10 th of a degree reported in minutes.		varchar (7)
trunc_disp_end_lat	4	Latitude of end of event truncated to 1/10 th of a degree reported in minutes.		varchar (6)
trunc_disp_end_long	4	Longitude of end of event truncated to 1/10 th of a degree reported in minutes.		varchar (7)
start_stats_area_code	4	Statistical area in which event started.		areacode

ce_event field descriptions continued...

start_area_code	4	Whether event occurred inside 12 mile zone, EEZ or on the High Seas <ul style="list-style-type: none"> · 12 = within 12 mile zone · EZ = within the EEZ (200 miles) but outside the 12 mile zone. · NZ = on land in New Zealand · ET = Outside the EEZ Note: fishing in the keyholes within the EEZ will be ET but have a start_fma_code of either 6 or 4	Derived only when a lat/long combination entered.	areacode
op_event_type	4	The type of event being stored (F ishing, P roduction, E nvironment or T rip).		type
pos_confidence_scale	4	Confidence in position data.	No longer used.	code
start_fma_code	4	The fisheries management area in which an event started.	Derived only when a lat/long combination entered.	areacode
client_key	4	System generated number identifying the permit holder.		keys
client_no*	8	Number assigned to a permit holder by the Ministry of Fisheries.		id
client_name	8	Legal name of permit holder.		perorgname
registry_code	4	An office or region code	Historic	code
vessel_key *	4	System generated number identifying the vessel fishing.		keys
vessel_id	8	Vessel registration number or call sign if foreign licensed.		id
vessel_no	8	Vessel registration number.		id
vessel_name	8	Registered vessel name.		name
vessel_reg_type	4	Vessel registration type, (D omestic, C harter, F oreign licensed or U nknown).		type
fishyear*	4	Fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1997).	Won't be correct for species which have a different fishing year e.g. rock lobsters.	smallint
display_fishyear	4	Formatted fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1996/97).	See fishyear.	varchar (7)
dcf_key *	4	System generated number identifying a single form.	When combined with version_seqno will identify all of the events relating to a single form.	keys
form_number	4	The ID number printed on each form.	Not unique because there are many different types of forms. Referred to in catcheff views as dcf_id_number.	id_int
form_type	4	The type of the form. CELR is abbreviated to CEL , TCEPR to TCP , TCER to TCE , LCER to LCE , LTCER to LTC , CLR to CLR , SJ CER to SJC , TLCER to TUN , PCELR to PCE , NCELR to NCE , NFPS CR to NPC , ECER to ECE , ECLR to ECL , HSCER to HCE , HSTCER to HTC , HSTLCER to HTU and HSLCER to HLC .	Referred to in catcheff views as dcf_defn_group_type.	type
dcf_status	4	Validation status of this form.	Not used	status
trip*	4	A system generated number allocated to each of the events that took place for one vessel between its trip start and end dates.		keys

ce_event field descriptions continued...

literal_yn	4	Boolean - This is the literal version of the data.		yn
interp_yn	4	Boolean - Either an interpreted version of the data does not exist, or it does exist and this is it. When selecting “Y”, the interpreted version of the form will be retrieved if there is one , otherwise the literal version will be provided.		yn
resrch_yn	4	Boolean - Either a research version of the data does not exist, or it does exist and this is it.		yn
event_catcher_id	4	Fisher’s name (TUN, HTU, LCE, HLC, LTC, TCE and ECE forms only)		ccode

Mfish View Name: **ce_fishing_event**

External View Name: **x_ce_fishing_event**

Description: Stores effort and some environment data relating to a particular event of type “fishing”.

Field	Ext	Usage	Comments	Field Type
event_key *	4	System generated number identifying a single fishing event.	Unique key when combined with version_seqno.	keys
version_seqno	4	System generated number identifying the version of a single fishing event.	Unique key when combined with event_key.	seqno
group_key	4	System generated number used to link to tables in the form database.		keys
return_seqno	4	The page number of a multipage form.	Not used.	seqno
start_datetime *	4	The start date & time for fishing.		datetime
end_datetime	4	The end date & time for fishing.		datetime
primary_method*	4	Code for fishing method used (TCP = gear code).		method
method_system_type	4	Always “ FIC ”.	Not used.	type
target_species *	4	Target species.		species
fishing_duration	4	# Usage varies - see contents of effort fields table. The fishing duration is decimalised e.g. 30 minutes will be recorded as 0.5		duration
fishing_day_duration	4	Number of hours spent fishing during daylight. Early squid jigging forms only.	Historical - Stores data which is no longer collected.	duration
fishing_night_duration	4	Number of hours spent fishing at night. Early squid jigging forms only.	Historical - Stores data which is no longer collected.	duration
catch_weight	4	The total weight of catch for this fishing event as estimated at the time.	Do not confuse with catch_weight from the estimated subcatch table which represents weights for individual species.	weight
catch_weight_other	4	The total weight of all other species caught in a set that were not recorded as one of the first eight species caught (by weight). Collected on LCE , HLC, NCE, TCE and LTC forms only.		weight
non_fish_yn	4	Flag to indicate if there was any non-fish incidental catch for the fishing event.	First introduced in Oct 2006 on the NCE form and then on other forms at later dates.	yn
fishing_event_effort_type	4	Very general method code (S = SQJ, L = TUN, T = others).		type
confidence_scale	4	Confidence in the method & target species data.	No longer used.	code
effort_depth	4	TCP/TCE - Groundrope depth, SJC - Deepest lure.		depth
effort_height	4	# Usage varies - see contents of effort fields table at the end of this document.		height
effort_num	4	# Usage varies - see contents of effort fields table at the end of this document.		num
effort_num_2	4	Currently number of meshes as recorded on the NCE form.	Introduced on the NCE form in Oct 2006.	num
effort_seqno	4	The set or tow number since the start of the trip. This is only collected on LCE, TCE & LTC forms.		seqno
effort_total_num	4	# Usage varies - see contents of effort fields table at the end of this document.		number
effort_width	4	# Usage varies - see contents of effort fields table at the end of this document.		width
effort_length	4	Length of line (TUN form only) in nautical miles.	Introduced Apr/May 2003.	length

effort_speed	4	Estimated speed of trawl (TCP/TCE forms only).		speed
surface_temp	4	Sea surface temperature (CEL forms with method PS only).		temperature
effort_time	4		Not used.	duration
total_hook_num	4	# Usage varies – see contents of effort fields table.		number
total_basket_num	4	Number of baskets, (TUN forms only).	Not collected after April 2003.	num
set_end_datetime	4	Date/time setting of longline finished, (TUN forms only).		datetime
haul_start_datetime	4	Date/time hauling of longline started (TUN, HTU, LCE, LTC and HLC forms only).		datetime
haul_start_wind_speed	4	Wind speed (m/s) at time hauling of longline started (TUN forms only).	Not collected after April 2003.	speed
haul_end_wind_speed	4	Wind speed (m/s) at time hauling of longline ended, (TUN forms only).		speed
set_start_wind_speed	4	Wind speed (m/s) at time setting of longline started (TUN form only).	Introduced Apr/May 2003.	speed
set_start_wind_direction	4	Wind direction at time setting of longline started (TUN form only).	Introduced Apr/May 2003.	direction
haul_end_wind_direction	4	Wind direction at time hauling of longline ended (TUN form only).	Introduced Apr/May 2003.	direction
haul_end_surface_temp	4	Sea surface temperature at time hauling of longline ended (TUN form only).	Introduced Apr/May 2003.	temperature
float_num	4	Number of floats (TUN form only).	Introduced Apr/May 2003.	num
light_stick_num	4	Number of light sticks (TUN form only).	Introduced Apr/May 2003.	num
line_shooter_yn	4	Line shooter (Y/N) (TUN form only).	Introduced Apr/May 2003.	yn
catcher_id	4	Diver's name (PCE only).	Introduced 01 Oct 2001.	varchar (5)
condition_type	4	Diving conditions (PCE only).	Introduced 01 Oct 2001.	flag
total_net_length	4	# Usage varies – see contents of effort fields table.		length
double_reel_num	4	Number of double reel jigging machines in use, (SJC forms only).		num
pair_trawl_yn	4	This was a pair trawl event Y = yes or N = no.		yn
bottom_depth	4	Depth below sea level of sea floor (TCP, TCE, HTC, LCE, HLC & SJC forms only).		depth
effort_confidence_scale	4	Confidence in the effort data.	No longer used.	code
spotter_callsign	4	Call sign of spotter aircraft (CEL forms with method PS only).		id
bottom_temp	4		Not used.	temperature
days_fished_num	4		Not used.	num
effort_1_days_num	4		Not used.	num
effort_2_days_num	4		Not used.	num
column_a	4	The information recorded in the effort A column of a form type CEL.	Repeats information stored in one of the fields marked #.	descript
column_b	4	The information recorded in the effort B column of a form type CEL.	Repeats information stored in one of the fields marked #.	descript
column_c	4	The information recorded in the effort C column of a form type CEL.	Repeats information stored in one of the fields marked #.	descript
column_d	4	The information recorded in the effort D column of a form type CEL.	Repeats information stored in one of the fields marked #.	descript

Mfish View Name: **ce_landing**

External View Name: **x_ce_landing**

Description: Stores landings data and data on the location of landing or transshipping relating to a particular event of type “production”

Field	Ext	Usage	Comments	Field Type
event_key*	4	System generated number identifying a single landing or transshipping event.	Because multiple species can occur for one landing or transshipping event this is not a unique key even when combined with version_seqno.	keys
version_seqno	4	System generated number identifying the version of a single landing or transshipping event.	.	seqno
group_key	4	System generated number used to link to tables in the form database.		Keys
specprod_seqno	4	System generated number used in conjunction with the above three fields to create a unique key.		Seqno
return_seqno	4	Intended to be used to track landings across multiple forms.	Not used.	Seqno
specprod_action_type	4	General nature of event, will always be 'LAN' = landing.		Type
landing_datetime*	4	The start date for landing or transshipping.		Datetime
landing_name	4	Point of landing or call sign of transshipment vessel (CEL, NCE and CLR only).		Name
species_code*	4	Three letter code identifying the species being landed or transhipped.		Species
species_name	4	Species common name.		Name
species_class	4	Species class name (list available in appendix 3).		Code
fishstock_code*	4	Fishstock code.		Areacode
state_code	4	Processed state of fish.		Code
destination_type	4	Type of destination for fish e.g. landed, transhipped etc.		Type
unit_type	4	Type of packaging e.g. container, box, sack, single fish etc.		Type
unit_num	4	Number of containers.		Number
unit_num_latest	4	Number of containers from latest trip.	Introduced on NCE form currently not collected on other form types.	Number
unit_num_other	4	Number of containers from other trips	Introduced on NCE form currently not collected on other form types.	Number
unit_weight	4	Average weight of each container.		Weight
conv_factor	4	Conversion factor.		Factor
green_weight	4	Green weight of fish.		Weight
green_weight_type	4	How green weight was calculated by MFish (ACTual, Fisher Back Calculated, BACK calculated, calculated from CONTainers, ESTimated).		type
processed_weight	4	Processed weight of fish (processed weight x conversion factor = green weight).		weight
processed_weight_type	4	How processed weight was calculated (see green_weight_type).		type

qrn_key	4	System generated number identifying the Quota Registration Key of the person/organisation that the fish was caught against. This is a historical variable that is only relevant to pre Oct 2001 returns.	Generated for QRN details provided on forms used prior to 01 Oct 2001.	keys
qrn_no*	8	Quota Registration Number. This is no longer collected unless an older version of the form is provided.	Collected on the forms used prior to 01 Oct 2001.	id
qrn_name	8	Legal name of the person/organisation the fish was caught against. This is no longer collected unless an older version of the form is provided.	Collected on the forms used prior to 01 Oct 2001.	perorgname
lfr_key	4	System generated number identifying the Licensed Fish Receiver that received the fish.		keys
lfr_no*	8	Licensed Fish Receiver number.		id
lfr_name	8	Legal name of the Licensed Fish Receiver that received the fish.		perorgname
invoice_num	4	Purchase tax invoice number from LFR.		cinvoice
tranship_vessel_key	4	System generated number identifying the vessel receiving a transhipment.		keys
tranship_vessel_id	8	Vessel registration number, or call sign if foreign licensed, of vessel receiving a transhipment.		id
tranship_vessel_no	8	Vessel registration number of vessel receiving a transhipment.		id
tranship_vessel_name	8	Registered vessel name of vessel receiving a transhipment.		name
tranship_reg_type	4	Vessel registration type of vessel receiving a transhipment.		type
land_confidence_scale	4	Confidence in landing/transshipping data.	No longer used.	code
proc_confidence_scale	4	Confidence in processing data.	Not used.	code
days_caught_num	4	Number of days of fishing which resulted in the catch now being landed/transhipped.	Not used.	num
vessel_key *	4	System generated number identifying the vessel landing/transshipping.		keys
vessel_id	8	Vessel registration number or call sign if foreign licensed.		vesid
vessel_no	8	Vessel registration number.		id
vessel_name	8	Registered vessel name.		name
vessel_reg_type	4	Vessel registration type, (D omestic, C harter, F oreign licensed or U nknown).		type
flag_nationality	4	Nationality code identifying flag state/original port of registry of vessel.		type
owner_nationality	4	Nationality code identifying nationality of vessel owner.		type
boat_nationality	4	Nationality code identifying nationality of vessel.		type
registered_owner_key	4	System generated number identifying the registered owner.		keys
client_key	4	System generated number identifying the permit holder.		keys
client_no*	8	Number assigned to a permit holder by the Ministry of Fisheries.		id
client_name	8	Legal name of permit holder.		perorgname
fishyear*	4	Fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1997).	Won't be correct for species which have a different fishing year e.g. rock lobsters.	year

display_fishyear	4	Formatted fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1996/97).	See fishyear.	Varchar (7)
dcf_key *	4	System generated number identifying a single form.	When combined with version_seqno will identify all of the events relating to a single form.	keys
form_number	4	The ID number printed on each form.	Not unique because there are many different types of forms. Referred to in catcheff views as dcf_id_number.	id_int
form_type	4	The type of the form. CELR is abbreviated to CEL , CLR to CLR , PCELR to PCE , NCELR to NCE , ECLR to ECL and HSCELR to HCE .	Referred to in catcheff views as dcf_defn_group_type.	type
trip*	4	A system generated number allocated to each of the events that took place for 1 vessel between its trip start and end dates.		keys
trip_start_datetime	4	Derived start date for the trip that the landing relates to. This is created when the trip key is generated		datetime
trip_end_datetime	4	Derived end date for the trip the landing relates to. This is created when the trip key is generated		datetime
entered_trip_start_datetime	8	Start date for the trip as it was originally recorded on the catch effort return. Note: it is recommended that the derived trip dates be used for reporting.		datetime
entered_trip_end_datetime	8	End date for the trip as it was originally recorded on the catch effort return. Note: it is recommended that the derived trip dates be used for reporting.		datetime
literal_yn	4	Boolean - This record is the literal version of the data.		yn
interp_yn	4	Boolean - Either an interpreted version of the data does not exist, or it does exist and this is it. When selecting "Y", the interpreted version of the form will be retrieved if there is one , otherwise the literal version will be provided		yn
resrch_yn	4	Boolean - Either a research version of the data does not exist, or it does exist and this is it.		yn
est_greenweight	4	Estimated landed green weight (by fisher). PCE and ECL forms only	Introduced Oct 2001	weight

Mfish View Name: **ce_environment_data**

External View Name: **x_ ce_environment_data**

Description: Stores environment data relating to a particular event of type “environment”.

Field	Ext	Usage	Comments	Field Type
event_key*	4	System generated number identifying a single environmental event.	Unique key when combined with version_seqno.	keys
version_seqno	4	System generated number identifying the version of a single environmental event.	Unique key when combined with event_key.	seqno
group_key	4	System generated number used to link to tables in the form database.		keys
surface_temp	4	Sea surface temperature (TCP, SJC & TUN forms).		temperature
bottom_temp	4	Sea bottom temperature (TCP forms only).		temperature
wind_speed	4	Wind speed metres/second (SJC forms only).		speed
wind_direction	4	Wind direction (SJC forms only).		direction
windforce_beaufortnum	4	Wind force/ beaufort scale.	Not used.	beaufortnum
cloud_type	4	2 letter code for type of cloud (old TUN forms only).	Not collected after April 2003.	type
cloud_cover_amount	4	Numeric code showing number of eighths cloud cover (old TUN forms only).	Not collected after April 2003.	amount
bottom_depth	4		Not used.	depth
confidence_scale	4	Confidence in environment data.	No longer used.	code
start_datetime*	4	The start date for the event.		datetime
vessel_key*	4	System generated number identifying the vessel fishing.		keys
vessel_reg_type	4	Vessel registration type (D omestic, C harter, F oreign licensed or U nknown).		type
client_key*	4	System generated number identifying the permit holder.		keys
fishyear*	4	Fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1997).	Wont be correct for species which have a different fishing year e.g. Rock Lobsters.	smallint
display_fishyear	4	Formatted fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1996/97).	See fishyear.	varchar (7)
dcf_key*	4	System generated number identifying a single form.	When combined with version_seqno will identify all of the events relating to a single form.	keys
form_number	4	The ID number printed on each form.	Not unique because there are many different types of forms. Referred to in catcheff views as dcf_id_number.	id_int
form_type	4	The type of the TLCER form is abbreviated to TUN , HSCER to HCE , HSTCER to HTC and HSTLCER to HTU .	Referred to in catcheff views as dcf_defn_group_type.	type
literal_yn	4	Boolean – This record is the literal version of the data.		yn
interp_yn	4	Boolean - Either an interpreted version of the data does not exist, or it does exist and this is it.		yn
resrch_yn	4	Boolean - Either a research version of the data does not exist, or it does exist and this is it.		yn

Mfish View Name: **ce_processed_catch**

External View Name: **x_ ce_processed_catch**

Description: Stores production data relating to a particular event of type “production”

Field	Ext	Usage	Comments	Field Type
event_key*	4	System generated number identifying a single processing event.	Because multiple species can occur for one processing event this is not a unique key even when combined with version_seqno.	keys
version_seqno	4	System generated number identifying the version of a single processing event.		seqno
group_key	4	System generated number used to link to tables in the form database.		keys
specprod_seqno	4	System generated number used to in conjunction with the above 3 fields to create a unique key.		seqno
return_seqno	4	Intended to be used to track landings across multiple forms.	Not used.	seqno
specprod_action_type	4	General nature of event, will only contain events with specprod_action_type of PRO = processing , OFF = offal production or DIS = discarded.		type
processed_datetime*	4	The start date for processing.		datetime
species_code*	4	Three letter code identifying the species being processed.		species
species_name	4	Species common name.		name
species_class	4	Species class name.		code
state_code	4	Processed state of fish.		code
unit_type	4	Type of packaging (container, box, sack, single fish etc).		type
unit_num	4	Number of containers or litres of oil produced where specprod_action_type = “OFF”.		number
unit_weight	4	Average weight of each container.		weight
conv_factor	4	Conversion factor.		factor
processed_weight	4	Processed weight of fish (processed weight X conversion factor = green weight).		weight
processed_weight_type	4	How processed weight was calculated, (see green_weight_type).		type
green_weight	4	Green weight of fish.		weight
green_weight_type	4	How green weight was calculated by Mfish, (ACT ual or calculated from CON tainers).		type
proc_confidence_scale	4	Confidence in processing data.	No longer used.	code
days_caught_num	4	Number of days of fishing which resulted in the catch now being landed.	Not used.	num
vessel_key*	4	System generated number identifying the vessel fishing.		keys
vessel_id	8	Vessel registration number or call sign if foreign licensed.		vesid
vessel_no	8	Vessel registration number.		id
vessel_name	8	Registered vessel name.		name
vessel_reg_type	4	Vessel registration type (D omestic, C harter, F oreign licensed or U nknown).		type

ce_processed_catch field descriptions continued...

flag_nationality	4	Nationality code identifying flag state/original port of registry of vessel.		type
owner_nationality	4	Nationality code identifying nationality of vessel owner.		type
boat_nationality	4	Nationality code identifying nationality of vessel.		type
registered_owner_key	4	System generated number identifying the registered owner.		keys
client_key	4	System generated number identifying the permit holder.		keys
client_no*	8	Number assigned to a permit holder by the Ministry of Fisheries.		id
client_name	8	Legal name of permit holder.		perorgname
fishyear*	4	Fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1997).	Won't be correct for species which have a different fishing year e.g. rock lobsters.	year
display_fishyear	4	Formatted fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1996/97).	See fishyear.	varchar (7)
dcf_key *	4	System generated number identifying a single form.	When combined with version_seqno will identify all of the events relating to a single form.	keys
form_number	4	The ID number printed on each form.	Not unique because there are many different types of forms. Referred to in catcheff views as dcf_id_number .	id_int
form_type	4	The type of the form. TCEPR is abbreviated to TCP , SJ CER to SJC , TLCER to TUN and HS TLCER to HTU .	Referred to in catcheff views as dcf_defn_group_type .	type
trip*	4	A system generated number allocated to each of the events that took place for 1 vessel between its trip start and end dates.		keys
trip_start_datetime	4	Start date for the trip that the processing relates to. Note: this is the derived date that is created when the trip key is generated.		datetime
trip_end_datetime	4	End date for the trip the processing relates to. Note: this is the derived date that is created when the trip key is generated.		datetime

resrch_yn	4	Boolean - Either a research version of the data does not exist, or it does exist and this is it.		yn

Mfish View Name: **ce_trip_details**

External View Name: **x_ce_trip_details**

Description: Stores the main details relating to a trip based on derived trip data.

Field	Ext	Usage	Comments	Field Type
trip*	4	A system generated number allocated to each of the events that took place for 1 vessel between its trip start and end dates.		keys
trip_version	4	System generated number identifying the version of a single trip.		seqno
start_datetime *	4	The start date & time for fishing. Note: this is the derived date that is created when the trip key is generated. The original trip dates are available in the trip event view.		datetime
end_datetime	4	The end date & time for fishing. Note: this is the derived date that is created when the trip key is generated. The original trip dates are available in the trip event view.		datetime
client_key*	4	System generated number identifying the permit holder.	Not usually populated i.e. NULL	keys
vessel_key*	4	System generated number identifying the vessel fishing.		keys

Mfish View Name: **ce_bait**

External View Name: **x_ce_bait**

Description: Stores data on the bait used. This is recorded on the 1990 and 2003 versions of TLCER forms only. The 1991 and 2001 version of the tuna form did not record bait used. For the 2003 version this table stores 4 rows per event for each of the 4 unit_type

Field	Ext	Usage	Comments	Field Type
event_key*	4	System generated number identifying a single fishing event.	Unique key when combined with version_seqno.	keys
version_seqno	4	System generated number identifying the version of a fishing event.	Unique key when combined with event_key.	seqno
group_key	4	System generated number used to link to tables in the form database.		keys
species_code*	4	Standard 3 letter code identifying the species used as bait.		species
equip_item_key	4	?	Not used.	keys
unit_type	4	A one letter code indicating the general nature of the bait used. The bait types are: S quid or S aury (old forms), L ure (collected on pre 1995 forms), A rtificial, F ish or U nspecified. Note: bait type was not collected between ~1995 and 2000		type
unit_num	4	1991 tuna form: represents the number of hooks baited with this type of bait. 2003 tuna form: represents the percentage of this bait type.		num
confidence_scale	4	Confidence in the data.	No longer used.	code

Mfish View Name: **ce_event_assoc_object**

External View Name: **x_ce_event_assoc_object**

Description: Stores details of vessels involved in pair fishing (CEL, TCP or TCE forms) and is only used to link pair vessel to a fishing event.

Field	Ext	Usage	Comments	Field Type
event_key*	4	System generated number identifying a single fishing event.	Unique key when combined with version_seqno.	keys
version_seqno	4	System generated number identifying the version of a fishing event.	Unique key when combined with event_key.	seqno
vessel_key*	4	The key identifying the other vessel in a pair fishing event.	Referred to as object_key in the corresponding view in catcheff .	keys
event_assoc_object_type	4		Always has the value "PRV"	type

Mfish View Name: **ce_catcher**

External View Name: **X_ce_catcher**

Description: Stores the catcher_key derived from the catcher id for PCELR, ECER, LTCER, TCER, TLCER, HS LCER and HS TLCER forms.

Field	Ext	Usage	Comments	Field Type
catcher_key	4	System generated key identifying a unique catcher id.	Unique key.	keys
catcher_id	4	The name of the diver as entered on the form.		ccode

Mfish View Name: **ce_npc_fishing_event**

External View Name: **X_ce_npc_fishing_event**

Description: Stores effort data reported on the NPC form relating to a particular event, when a non fish or protected species has been caught.

Field	Ext	Usage	Comments	Field Type
event_key	4	System generated number identifying a single NPC fishing event.	Unique key when combined with version_seqno.	keys
version_seqno	4	System generated number identifying the version of a fishing event.	Unique key when combined with event_key.	seqno
group_key	4	System generated number used to link to tables in the form database.		keys
method_system_type	4	Always "FIC".	Not used.	type
fishing_event_effort_type	4	Always "X".		type
confidence_scale	4	Confidence in the data.	No longer used.	code
return_seqno	4	The page number of a multi-page form. Always 1 for NPC forms	Not used	seqno
effort_confidence_scale	4	Confidence in the effort data.	No longer used.	code
start_datetime	4	The start date & time for fishing.		datetime
end_datetime	4	Always "NULL" (The end date & time for fishing).		datetime

vessel_key	4	System generated number identifying the vessel fishing.		keys
client_key	4	System generated number identifying the permit holder.		keys
fishyear	4	Fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1997).	Won't be correct for species which have a different fishing year e.g. rock lobsters.	smallint
dcf_key	4	System generated number identifying a single NPC form.	When combined with version_seqno will identify all of the events relating to a single form.	keys
form_number	4	The ID number printed on each form.	Not unique because there are many different types of forms. Referred to in catcheff views as dcf_id_number.	id_int
form_type	4	Always "NPC".	Referred to in catcheff views as dcf_defn_group_type.	type
vessel_reg_type	4	Vessel registration type, (D omestic, C harter, F oreign licensed or U nknown).		type
literal_yn	4	Boolean - This is the literal version of the data.		yn
interp_yn	4	Boolean - Either an interpreted version of the data does not exist, or it does exist and this is it. When selecting "Y", the interpreted version of the form will be retrieved if there is one, otherwise the literal version will be provided		yn
resrch_yn	4	Boolean - Either a research version of the data does not exist, or it does exist and this is it.		yn
client_name	8	Legal name of permit holder.		perorgname
client_no	8	Number assigned to a permit holder by the Ministry of Fisheries.		id
vessel_id	8	Vessel registration number or call sign if foreign licensed.		vesid
vessel_name	8	Registered vessel name.		name
ce_form_type	4	The type of the Catch effort form the commercial fishing effort is reported on. CELR is abbreviated to CEL , TCEPR to TCP , TCER to TCE , LCER to LCE , LTCER to LTC , CLR to CLR , SJ CER to SJC , TLCER to TUN , PCELR to PCE , NCELR to NCE , ECER to ECE , ECLR to ECL , HSCELR to HCE , HSTCER to HTC , HSTLCER to HTU and HSLCER to HLC .	Referred to in catcheff views as dcf_defn_group_type.	type
ce_form_number	4	The ID number printed on the associated Catch Effort form.	Not unique because there are many different types of forms. Referred to in catcheff views as dcf_id_number.	id_int
ce_dcf_key	4	System generated number identifying the Catch Effort form.	When combined with version_seqno will identify all of the events relating to a single form.	keys
ce_event_key	4	System generated number identifying the associated Catch Effort fishing event. *See notes below about derivation rules used.	Unique key when combined with version_seqno.	keys
ce_trip	4	A system generated number allocated to the Catch Effort trip.		keys

npc_event_key	4	Identical to event_key (system generated number identifying a single NPC fishing event).	Unique key when combined with version_seqno.	keys
---------------	---	--	--	------

* Rules used to match the NPC data to the associated fishing event reported on the catch effort form.

For all form_types except CELR

- Form type and number of effort form must match the one listed on the NPC form
- The start_datetime of the NPC event must match the start_datetime of the effort form fishing event
- The effort form fishing event non_fish_yn flag must be 'Y'
- The effort form fishing event interp_yn flag must be 'Y'

For CELR forms

- Form number of the CELR must match the CELR one listed on the NPC form
- The start_datetime of the CELR fishing event must be on the same day
- The CELR fishing event non_fish_yn flag must be 'Y'
- The CELR fishing event interp_yn flag must be 'Y'
- The CELR fishing event must be the only one on the form meeting the above criteria

Mfish View Name: **ce_npc_estimated_subcatch**

External View Name: **X_ce_npc_estimated_subcatch**

Description: Stores estimated catch data when a non fish or protected species has been reported caught on a NPC form.

Field	Ext	Usage	Comments	Field Type
event_key	4	System generated number identifying a single NPC fishing event.	Unique key when combined with version_seqno.	keys
version_seqno	4	System generated number identifying the version of a fishing event.	Unique key when combined with event_key.	seqno
group_key	4	System generated number used to link to tables in the form database.		keys
catch_weight	4	Estimated weight (kg) of corals, sponges or bryozoans that has been caught.		weight
catch_num	4	Total number of seabirds, mammals, reptiles or protected fish caught.		num
species_code	4	Three letter code for species caught.		species
species_name	4	Species common name.		Name
confidence_scale	4	Confidence in the data.	No longer used.	code
start_datetime	4	The start date & time for fishing.		datetime
vessel_key	4	System generated number identifying the vessel fishing.		keys
client_key	4	System generated number identifying the permit holder.		keys
dcf_key	4	System generated number identifying a single form.	When combined with version_seqno will identify all of the events relating to a single form.	keys
literal_yn	4	Boolean - This is the literal version of the data.		yn

interp_yn	4	Boolean - Either an interpreted version of the data does not exist, or it does exist and this is it. When selecting "Y", the interpreted version of the form will be retrieved if there is one , otherwise the literal version will be provided		yn
resrch_yn	4	Boolean - Either a research version of the data does not exist, or it does exist and this is it.		yn
fishyear	4	Fishing year (e.g. 1 Oct 1996 to 30 Sep 1997 = 1997).	Won't be correct for species which have a different fishing year e.g. rock lobsters.	smallint
client_name	8	Legal name of permit holder.		perorgname
client_no	8	Number assigned to a permit holder by the Ministry of Fisheries.		id
vessel_id	8	Vessel registration number or call sign if foreign licensed.		vesid
vessel_name	8	Registered vessel name.		name
form_type	4	Always "NPC".	Referred to in catcheff views as dcf_defn_group_type.	type
form_number	4	The ID number printed on each form.	Not unique because there are many different types of forms. Referred to in catcheff views as dcf_id_number.	id_int
vessel_reg_type	4	Vessel registration type, (D omestic, C harter, F oreign licensed or U nknown).		type
caught_uninjured_num	4	The number of seabirds, mammals, reptiles or protected fish that were caught uninjured.		num
caught_injured_num	4	The number of seabirds, mammals, reptiles or protected fish that were caught injured.		num
caught_dead_num	4	The number of seabirds, mammals, reptiles or protected fish that were caught dead.		num
ce_event_key	4	System generated number identifying a single fishing event.	Unique key when combined with version_seqno.	keys
ce_trip	4	A system generated number allocated to each of the events that took place for one vessel between its trip start and end dates.		keys
npc_event_key	4	Identical to event_key (system generated number identifying a single NPC fishing event).	Unique key when combined with version_seqno.	keys

5.0 Meanings of Effort Variables

The meaning of the data stored in the various effort related fields in the **ce_fishing_event** view also change depending on the form type and fishing method used.

The following table describes the contents of these fields for each form type and fishing method.

CELR:

Form type and method	fishing_duration	effort_height	effort_num	effort_total_num	effort_width	total_hook_num	total_net_length	effort_depth	effort_length
CEL BT, BPT, MW & MPT	Time that gear was at target depth.	Headline height (m)	Number of tows in the day	Number of nets	Wing spread (m)				
D MH	Time between start of first shoot and finish of last.		Number of shots in the day <i>(not for method MH)</i>		Dredge width (m)				
SN & DN	Time from start of setting first net until end of hauling last.				Mesh size (mm)		Total length of nets hauled that day (m)		
RLP, CP, EP, FP & FN			Number of pots/traps/nets in water at midnight	Number of pot/trap lifts in the day					
SLL, BLL, DL, SCP, CRP, OCP & TL			Number of sets hauled in the day.			Number of hooks hauled in the day			
HL, T & PL	Total catching time		Maximum number of lines used at 1 time			Maximum number of hooks used at a time			
PS, DS, DPS, L, BS, DPN, SCN & RN			Number sets/shots in the day				Total length of net used (m)*	<i>*not for DPN & SCN</i>	
H, DI	Total person hours spent gathering/diving		Number of people gathering or diving						

Other Form Types:

Form type	fishing_duration	effort_height	effort_num	effort_num2	effort_total_num	effort_width	total_hook_num	total_net_length	effort_depth	effort_length
TCP	Calculated from the start and end time of the shot	Headline height (m)	Defaults to one per tow.		Number of nets	Wing spread (m)			Ground rope depth	
TCE	Calculated from the start and end time of the shot	Headline height (m)	Defaults to one per tow.		Number of nets	Wing spread (m)			Ground rope depth	
TUN							Number of hooks	Length of longline (km). Prior to Apr/May 2003		Length of longline (nautical miles) From Apr/May 2003
SJC			Number of single reels in use							Deepest lure
LCE			Defaults to one per event (set)			Hook spacing (0.0 m)	Number of hooks set.			Length of line (m). Derived by multiplying the number of hooks by the hook spacing.
LTC			Defaults to one per set			Hook spacing (0.0 m)	Number of hooks set.			Length of line (m). Derived by multiplying the number of hooks by the hook spacing.
NCE	Time from start of setting to end of hauling	Derived effort_width (* effort_num2/1000)	Number of nets	Net height (number of meshes)		Smallest mesh size		Total length of all nets set		
ECE	Total number of house spent fishing if not using SN, FN, EP or FP				Number of fyke nets, eel pots, or fish traps lifted.			Total number of metres of nets hauled if set netting		
PCE	Time spent in water									

6.0 Meanings of Multiple Use Fields

The meaning of the date stored in the **start_datetime** and **end_datetime** fields will change depending on the type of event being considered.

For example - A CELR form can have fishing, landing and trip events associated with it. The field start_datetime within the event view could store the date of fishing for CELR fishing events, the date of landing for CELR landing events, or the date of the first day of the trip for CELR trip events.

The contents of the **start_datetime** and **end_datetime** fields, for each type of event, are given in the following table:

Form type	Event type	start_datetime	end_datetime
CEL	Fishing	Date of catch/effort data.	
(CEL)	Processing	Landing date.	
	Trip	First day of trip.	Last day of trip.
TCEPR	Fishing	Date and time trawl started.	Date and time trawl finished.
(TCP)	Processing	Date, (top left of form).	
	Environment	Date, (top left of form).	
TCER (TCE)	Fishing	Date and time trawl started.	
CLR	Processing	Landing date.	
(CLR)	Trip	First day of trip.	Last day of trip.
SJCER	Fishing	Date and time fishing started.	Date and time fishing finished.
(SJC)	Processing	Date fishing started, (middle left of form).	
	Environment	Date fishing started, (middle left of form).	
TLCER (TUN)	Fishing	Date and time line setting started.	Date and time line hauling finished.
	Processing	Date line setting started, (middle left of form).	
	Environment	Date line setting started, (older versions of TUN form only).	
ECER (ECE)	Fishing	Date gear was lifted.	
ECLR (ECL)	Processing	Landing date.	
	Trip	First day of the month stated on the return	Last day of the month stated on the return
PCELR	Fishing	Date of catch/effort data.	
(PCE)	Processing	Landing date.	
	Trip	Start of the day that the return was dated.	End of the day that the return was dated.
LCER (LCE)	Fishing	Date and time of the start of each set.	
LTCER (LTC)	Fishing	Date and time the set started	
NCELR	Fishing	Date and time of the start of set.	
(NCE)	Processing	Landing date.	
	Trip	First day of trip.	
NPC	Fishing	Date and time that the tow/set started	

APPENDIX 1: CURRENT CATCH, EFFORT AND LANDING RETURNS.

RELATIONSHIP BETWEEN FORMS AND FIELDS

The following diagrams illustrate the relationship between the information recorded by fishers on the forms, and where this data is stored on the warehouse database.

Much of the data is duplicated in several places on the database. This is especially true of dates and times. The diagrams usually show only one storage location for any item of information from a form. In each case an attempt has been made to guess the location that would be most commonly used to extract this item of information. It is this location that is shown on each diagram. Users should be aware that under some circumstances an easier option for extracting the date or time information that they require may exist. This information is available in the field descriptions given in section 4.4 of the documentation.

View names have been abbreviated as follows:

ev	ce_event
ev(F)	ce_event with op_event_type = "F" (fishing)
ev(P)	ce_event with op_event_type = "P" (processing)
ev(E)	ce_event with op_event_type = "E" (environment)
ev(T)	ce_event with op_event_type = "T" (trip)

Time: end of shot (24-hr clock)	:	:	:	:	:	:	:	:
Non-fish / Protected species catch?	Yes	No	Yes	No	Yes	No	Yes	No
Write the species code and estimated greenweight of each species caught during each shot. <i>For example, if you catch 1100 kg of snapper, write:</i> <input type="text"/> <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
More than 8 species? List the 8 species that you caught most of (by greenweight).	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Weight of all other species caught this shot	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Trawl Catch Effort Return

TCE 1234567

fi.form_type fi.form_number

3. Permit holder and vessel details

Name of permit holder

Name of vessel

Client number of permit holder

Registration number of vessel

Name of fisher (first letter of first name then first four letters of surname)

Registration number of other vessel (paired fishing)

I declare that the information I have given on this return is correct and complete, and that I have read and understood the explanatory notes supplied with this return.

Signature of permit holder or authorised person

Date signed / / 20

Do not forget that you need to complete a landing return. Send completed returns to PO Box 297, Wellington (NZ).

Lining Catch, Effort Return

fi.form_type = "LCE"

LCE 1234567

1. Complete a **separate return for each day** you start setting. Complete a **separate column** of catch and effort information for each line set. fi.form_number
2. Write the date these sets started fishing method hook spacing (metres) and name of fisher (first letter of first name then first four letters of surname)

Set number and Target species	fi.effort_seqno	fi.target_species	and	and	and	and			
Time: start of set (24-hr clock)	fi.start_datetime	:	:	:	:	:			
Latitude: start of set (degrees minutes)	fi.start_latitude	' S	' S	' S	' S	' S			
Longitude: start of set (degrees minutes E/W)	fi.start_longitude	' East ' West							
Bottom depth: start of set	fi.bottom_depth	metres	metres	metres	metres	metres			
Number of hooks set	fi.total_hook_num								
Date: start of haul (dd/mm/yy)	fi.haul_start_datetime	/	/	/	/	/			
Time: start of haul (24-hr clock)	:	:	:	:	:	:			
Non-fish / Protected species catch?	fi.non_fish_yn	Yes <input checked="" type="checkbox"/> No <input checked="" type="checkbox"/>	Yes <input checked="" type="checkbox"/> No <input checked="" type="checkbox"/>	Yes <input checked="" type="checkbox"/> No <input checked="" type="checkbox"/>	Yes <input checked="" type="checkbox"/> No <input checked="" type="checkbox"/>	Yes <input checked="" type="checkbox"/> No <input checked="" type="checkbox"/>			
Write the species code and estimated greenweight of each species caught during each set. <i>For example, if you catch 500kg of ling, write:</i> <table border="1" style="width: 100px; margin: 5px 0;"><tr><td>L I N</td><td>5 0 0</td><td>.0kg</td></tr></table>	L I N	5 0 0	.0kg	ca.species_code	ca.catch_weight	.0kg	.0kg	.0kg	.0kg

			.0kg	.0kg	.0kg	.0kg			
			.0kg	.0kg	.0kg	.0kg			
		.0kg	.0kg	.0kg	.0kg				
More than 8 species? List the 8 species that you caught most of (by greenweight).			.0kg	.0kg	.0kg	.0kg			
			.0kg	.0kg	.0kg	.0kg			
			.0kg	.0kg	.0kg	.0kg			
Weight of all other species caught this set	All other species	fi.catch_weight other	All other species	All other species	All other species	All other species			
		.0kg	.0kg	.0kg	.0kg	.0kg			

3. Permit holder and vessel details

Name of permit holder Name of vessel

Client number of permit holder Registration number of vessel

I declare that the information I have given on this return is correct and complete, and that I have read and understood the explanatory notes supplied with this return.

Signature of permit holder or authorised person

Date signed **20**

Paua Catch Effort Landing Return

Form number **PCE**

1. If this is a NIL return for an entire calendar month, then you only need to provide one PCELR for that month. Otherwise, provide a separate return for each day (in which diving for paua, or landing of paua, or both, occurred).

Is this a NIL return for a month?

Yes → Enter that month (e.g. "FEB") and year. **20** → Go to section 5.

No → Enter the date that this return is for. / / **20**
fi.start_datetime

2. Enter the paua quota management area dived. Complete a separate return for each QMA dived.

PAU

la.fishstock_code

3. Complete a separate line for each diver and each paua statistical area that they dived.

Name of diver <i>first letter of first name then first four letters of surname</i>	Paua statistical area	Time spent in water (h:mm)	Estimate (by fisher) of catch of blackfoot paua	Estimate (by fisher) of catch of yellowfoot paua	Diving conditions
.	.	.	.0kg	.0kg	.
.	fi.start_stats_area_code	fi.fishing_duration	ca.catch_weight ca.species_code="PAI"	ca.catch_weight ca.species_code="PAA"	fi.condition_type
.	fi.start_stats_area_code	fi.fishing_duration	.0kg	.0kg	fi.condition_type
fi.catcher_id	fi.start_stats_area_code	fi.fishing_duration	.0kg	.0kg	fi.condition_type
.	fi.start_stats_area_code	fi.fishing_duration	.0kg	.0kg	fi.condition_type
.	fi.start_stats_area_code	fi.fishing_duration	.0kg	.0kg	fi.condition_type
.	fi.start_stats_area_code	fi.fishing_duration	.0kg	.0kg	fi.condition_type

Use an additional page if you run out of space when recording this day's diving.

4. Complete a separate line for: • each landing (do not forget paua transhipped, or lost, or retained); and
• any change in destination, or container, or LFR, or invoice details.

Estimate (by permit holder or fisher) of greenweight	Destination type	Containers		For destination types L and T only	For destination type L only	
		Number	Type	Licensed Fish Receiver client number (or receiving vessel reg no. for transhipped paua)	Greenweight <i>when advised by the LFR</i>	Tax invoice number <i>when advised by the LFR</i>
.0kg	la.destination_type	la.unit_num	la.unit_type	la.lfr_no	la.green_weight .0kg	la.invoice_num
.0kg	la.destination_type	la.unit_num	la.unit_type	la.lfr_no	.0kg	la.invoice_num
.0kg	la.destination_type	la.unit_num	la.unit_type	la.lfr_no	.0kg	la.invoice_num

Use an additional page if you run out of space when recording this day's landings.

5. Permit holder and vessel details

Name of permit holder fi.client_name

Client number of permit holder fi.client_no

Name of vessel fi.vessel_name

Registration number of vessel
(enter "None" if no vessel was used) fi.vessel_id

rd.page_seqno

This return is one of pages submitted for the date entered at the top of this page.

I declare that the information I have given on this return is correct and complete, and that I have read and understood the explanatory notes supplied with this return.

Signature of permit holder or master

Date signed / / **20**

Send completed returns to PO Box 297, Wellington (NZ).

Freshwater Eel Catch Landing Return

Form number **ECL 006304**

1. Complete a separate return for each month.

Enter the month (e.g. "FEB" for February)

and year that this return is submitted for.

la.landing_datetime

2. Is this a NIL return for the month? **Yes** → Complete sections 1, 2 and 4. **No** → Complete all sections.
nl.dcf_key (if a dcf_key is present in this view then the form is a nil return)

3. Complete a separate line for: • each landing (do not forget discards or fish retained); and
• any change in fishstock, destination, LFR, or invoice details.

Date of landing	Fishstock		Estimate (by permit holder or fisher) of greenweight	Destination type	Complete these three columns only for fish that were disposed of to a Licensed Fish Receiver.		
	Species code	Area			Licensed Fish Receiver's client number	Greenweight when advised by the LFR	Tax invoice number when advised by the LFR
la.landing_datetime	la.fishstock_code for species only la.species_code		.0kg			.0kg	
			.0kg			.0kg	
			.0kg			.0kg	
			.0kg			.0kg	
			.0kg		la.lfr_no		
			.0kg			la.green_weight	
			.0kg				la.invoice_num
			.0kg			.0kg	
			.0kg			.0kg

Lining Catch, Effort Return

fi.form_type="LCE"

LCE 001165

- Complete a **separate return for each day** you start setting. Complete a **separate column** of catch and effort information for **each line set**. fi.form number
- Write the date these sets started fishing method hook spacing (metres) and name of fisher (first letter of first name then first four letters of surname)

Set number (since start of trip)	fi.effort_seqno							
Target species	fi.target_species							
Time: start of set (24-hr clock)	fi.start_datetime	:	:	:	:			
Latitude: start of set (degrees minutes)	fi.start_latitude	' S	' S	' S	' S			
Longitude: start of set (degrees minutes E/W)	fi.start_longitude	<input type="radio"/> East <input type="radio"/> West						
Bottom depth: start of set	fi.bottom_depth	metres	metres	metres	metres			
Number of hooks set	fi.total_hook_num							
Date: start of haul (dd/mm/yy)	fi.haul	/ /	/ /	/ /	/ /			
Time: start of haul (24-hr clock)	start_datetime	:	:	:	:			
Write the species code and estimated greenweight of each species caught during each set. <i>For example, if you catch 500kg of ling, write:</i> <table border="1" style="width: 100px; margin-top: 5px;"> <tr> <td>L I N</td> <td>5 0 0</td> <td>.0kg</td> </tr> </table> More than 8 species? List the 8 species that you caught most of (by greenweight).	L I N	5 0 0	.0kg	ca.species_code	ca.catch_weight	.0kg	.0kg	.0kg
	L I N	5 0 0	.0kg					
				.0kg	.0kg	.0kg		
				.0kg	.0kg	.0kg		
				.0kg	.0kg	.0kg		
				.0kg	.0kg	.0kg		
				.0kg	.0kg	.0kg		
				.0kg	.0kg	.0kg		
			.0kg	.0kg	.0kg			
Weight of all other species caught <u>this set</u>	All other species	fi.catch_weight_other	.0kg	All other species	.0kg			

3. Permit holder and vessel details

Name of permit holder Name of vessel

Client number of permit holder Registration number of vessel

I declare that the information I have given on this return is correct and complete, and that I have read and understood the explanatory notes supplied with this return.

APPENDIX 4: VESSEL SPECIFICATION DATA

Information about the fishing vessel is not collected on the catch effort forms but as part of the vessel registration/update process and this data is stored in a separate database. Listed below is the main table that contains the vessel specification information. Note some vessels have records dating back to before 01 October 1989 and at certain times some of the information fields listed below have not been collected.

Table: vs_vessel_history

Field	Description	Field Type
vessel_history_key	Unique internal identifier.	keys
history_start_datetime	The date that the data in the main table was updated with the details in this history record.	startdatetime
history_end_datetime	The date on which the data in the main table was updated with new data replacing the data in this history record.	enddatetime
vessel_key	Unique internal identifier that identifies a vessel.	keys
vessel_id	Vessel Number, issued by FishServe. A unique number that identifies a vessel. For a registered vessel – this becomes the vessel’s registration number.	id20
call_sign_id	The vessel’s call sign.	id20
vessel_name	Name of the vessel.	name50
previous_name	Name the vessel was previously known as.	name50
lloyds_imo_id	Lloyds IMO number.	id20
forum_fisheries_id	Forum fisheries number for the vessel.	id20
flag_nationality_code	Code of the country that the vessel is registered in.	code20
previous_flag_code	Code of the immediately preceding flag of the vessel.	code20
overall_length_metres	Overall length of the vessel in metres.	metres2
registered_length_metres	Registered length of the vessel. This may be different from the overall length.	metres2
draught_metres	Measure of how far the vessel extends below the waterline in metres.	metres2
beam_metres	Width of the vessel at its widest point (in Metres).	metres2
gross_tonnes	The gross tonnage of the vessel.	tonnes4
max_speed_knots	The maximum speed of the vessel in knots.	knots
service_speed_knots	Speed the boat normally travels at when cruising (knots).	knots
engine_kilowatts	Power output of the main engine in kilowatts.	kilowatts
max_duration_days	The maximum number of days the vessel can remain at sea.	duration
super_colour	The colour of the vessel’s superstructure.	code20
funnel_colour	The colour of the vessel’s funnel.	code20
hull_colour	The colour of the vessel’s hull.	code20
built_year	The year the vessel was built.	code5
tenders_number	The number of tenders on board the vessel.	number
resale_value_currency	The monetary value of the vessel including gear if resold.	value
total_crew_number	Total number of crew the vessel carries.	number
superstructure_position	The position of the vessel’s superstructure.	keys
superstructure_position_desc	The description of the vessel’s superstructure.	description20
base_region_code	Code identifying the region in New Zealand in which the base port is located.	code4
base_port_code	Code of the port in New Zealand the vessel uses as a base.	code4
hull_material_id	Identifies the material the hull is comprised of.	id20

Field	Description	Field Type
hull_material_desc	Describes the material the hull is comprised of.	description20
plotter_key	Identifies the type of plotter carried on the vessel.	keys
plotter_description	Describes the plotter carried on the vessel.	description50
meal_processing_yn	Identifies whether the vessel is capable of processing fishmeal.	yn
meal_daily_max_tonnes	The maximum amount of fishmeal that can be processed daily.	tonnes4
freeze_product_yn	Identifies whether the vessel can freeze product while at sea.	yn
freeze_daily_max_tonnes	The vessel's maximum daily freezing capacity in tonnes.	tonnes4
holds_number	Number of fish holds vessel has.	number
holds_size_cubicmeters	Total hold capacity of the vessel in cubic metres.	cubicmeters4
port_registry	Code of the vessel's port of registry.	id50
data_origin_code	Code specifying the origin of the vessel data e.g. CONVERSION, REGISTRATION.	code20
data_origin_key	A unique identifier of the source data. Relates directly to the data_origin_code.	keys
data_error_code	Error scale from data exchange.	code20
security_control_code	A code to control who can access this data.	int
origin_change_type	Origin of the change e.g. I - insert U - update	type1
origin_username	Source of change e.g. sa - system administrator, dataex - data exchange	username
history_update_datetime	The date and time this record was created.	endatetime
msa_number	Maritime Safety Authority number	id20
