## **EXECUTIVE SUMMARY**

**Anderson, O.F. (2013). Fish and invertebrate bycatch in New Zealand deepwater fisheries from 1990–91 until 2010–11.**

**New Zealand Aquatic Environment and Biodiversity Report No. 113. 57 p.**

Commercial catch-effort data and fisheries observer records of catch by species provided by the Ministry for Primary Industries (MPI) were used to estimate the level of individual fish and invertebrate species bycatch in each fishing year from 1990–91 to 2010–11 for the following Tier-1 deepwater fisheries:

### **Trawl fisheries**

- Arrow squid (SQU)
- Hoki/hake ling (HOK/HAK/LIN)
- Southern blue whiting (SBW)
- Jack mackerel (JMA)
- Orange roughy (ORH)
- Oreo (OEO)
- Scampi (SCI)

### **Longline fisheries**

- Ling (LIN)

The estimation process for the arrow squid fishery stratified according to fishery area, and estimates of precision were calculated using bootstrap methods. For the remaining fisheries no stratification was used and no estimates of precision were calculated.

Summary tables were made for each fishery, and for all fisheries combined, to provide an easy reference for the bycatch trend of each species or species group caught in these fisheries. Improvements in species identification, introduction of new codes, and changes in observer recording practices can have an effect on the apparent increase or decrease in the bycatch of certain taxa and should be considered when interpreting trends.

All of the fisheries examined showed measurable declines or increases in bycatch of certain species over time, and consistent declines or increases were seen for a few species across six or more of the eight fisheries. Those increasing were; starfish (Asteroidea), deepsea skates (*Notoraja* spp.), Baxters lantern dogfish (*Etmopterus baxteri*), Lucifer dogfish (*E. lucifer*), lanternfish (Myctophidae), rough skate (*Zearaja nasuta*), pale ghost shark (*Hydrolagus bemisi*), and javelinfish (*Lepidorhynchus denticulatus*). Those declining were; bluenose (*Hyperoglyphe Antarctica*), shark (unspecified), and skates (Rajidae and Arhynchobatidae). Future analyses will include a breakdown of trends by area and fishery within these New Zealand deepwater fisheries.

## **1. INTRODUCTION**

This report was prepared as an output from the Ministry for Primary Industries project DAE2010-02 “Bycatch monitoring and quantification of deepwater stocks” and addresses the following Specific objective for year-2.

4. To provide annual estimates of bycatch for nine Tier-1 species fisheries (SQU, SCI, HAK, HOK, JMA, ORH, OEO, LIN, SBW).

The purpose of this research was to compile an initial list of all species impacted by New Zealand deepwater fisheries, and the degree of that impact, which could be relatively rapidly produced and regularly updated. This would then provide the ability to detect early any downward (or upward) trends in bycatch of individual species in all fisheries, not just in the single fishery typically examined in any one year. By fine-tuning these estimates for one fishery each year (in this year arrow squid) and providing estimates of precision, a complete picture of the annual bycatch of a large number of species, across each fishery, can be built up over multiple years—with increasing precision in each year.

This report provides the first iteration of this plan, with updated estimates of bycatch and discards in the arrow squid trawl fishery (addressing Specific objectives 1–3 of DAE2010-02) presented in more detail in Anderson (2013).

## **2. METHODS**

Observer bycatch data for the period 1990–91 to 2010–11 were extracted from the MPI *cod* database for each of the nine Tier-1 target species, arranged into eight fisheries as follows: hoki/hake/ling trawl, jack mackerel trawl, orange roughy trawl, oreo trawl, southern blue whiting trawl, scampi trawl, arrow squid trawl, and ling longline. These data were subjected to error-checking procedures as described in Anderson (2013) for the arrow squid fishery.

The total catch and frequency of capture of each bycatch species was examined in each fishery, and those species for which there was a total of less than 10 kg of observed catch over the entire 21-year period, or which were observed caught on less than six occasions, were disregarded. It was considered that either the capture of such species was so rare as to be irrelevant, or the species code may have been incorrectly recorded by the observer. Annual bycatch ratios for the remaining individual QMS and non-QMS species (fish and invertebrates) were then calculated for each fishery.

Commercial catch records were also obtained from the Ministry for Primary Industries for each fishery, groomed according to the procedures described in Anderson (2013), then used to calculate annual effort (number of tows or longline sets) for each fishery.

For each fishery, excluding the arrow squid fishery, the annual species specific bycatch ratios were multiplied by the annual effort in the fishery, without stratification, to produce simple estimates of total annual bycatch without any estimates of precision. An indication of whether the bycatch of each species increased, decreased, or stayed relatively unchanged over time was calculated in the form of a slope coefficient for a loglinear regression fitted to the data.

For the arrow squid fishery, the procedure was similar but was extended to include an estimate of precision derived from an area-stratified bootstrapping procedure used for the combined species groups (QMS, non-QMS, and invertebrates) in Anderson (2013). This procedure rounds the estimates of total annual catch to the nearest 10 t and so species with less than this level of catch in at least one year were excluded.

See Anderson (2013) for a more detailed description of the general methodology used to extract and groom observer and commercial fishing return data, calculate bycatch ratios and annual levels, and estimate precision.

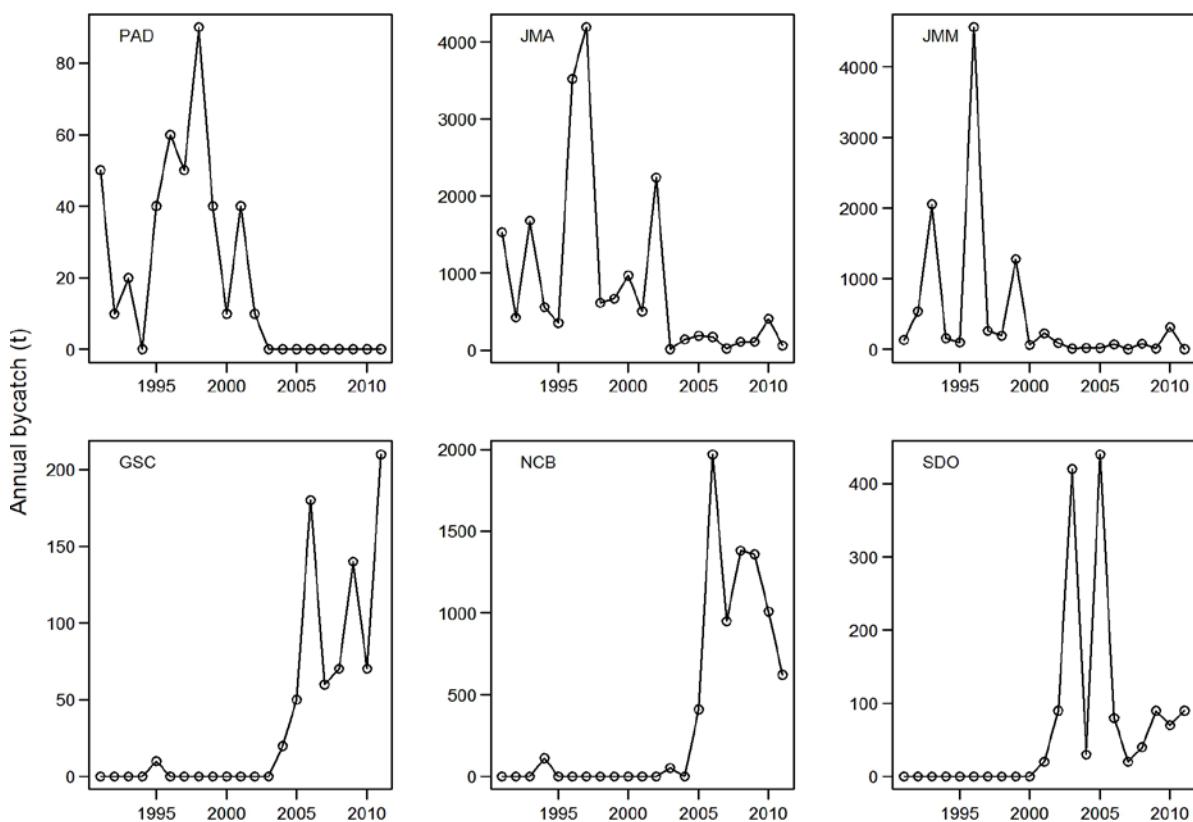

Tables were constructed for each fishery showing the annual estimated bycatch for each species, the slope coefficient and, for the arrow squid fishery, the estimated c.v. for each estimate. Plots were constructed for species within each fishery that showed the strongest declines and increases over time. A summary table was also constructed to allow visual comparison of trends in quantities of bycatch species caught across multiple fisheries.

### **3. RESULTS**

Annual bycatch estimates for individual species in each of the eight combined fisheries are given in Tables 1 to 8. The following is a brief summary of these tables. Note that in some cases the apparent increase or decrease in bycatch of a species is likely to be due to other factors including the introduction of new codes (for example the increase in bycatch of floppy tubular sponges in the hoki/hake/ling trawl fishery reflects the improved identification of these sponges in more recent years) and improvements in species identification over time (for example generic codes being replaced by species specific codes). Some codes may also have been misused, e.g., in the arrow squid fishery, the increase in bycatch of smooth red swimming crabs (*Nectocarcinus bennetti*) appears to be at the expense of bycatch of the similar-looking paddle crabs (*Ovalipes catharus*) with the seemingly generic code (PAD).

## Arrow squid trawl fishery

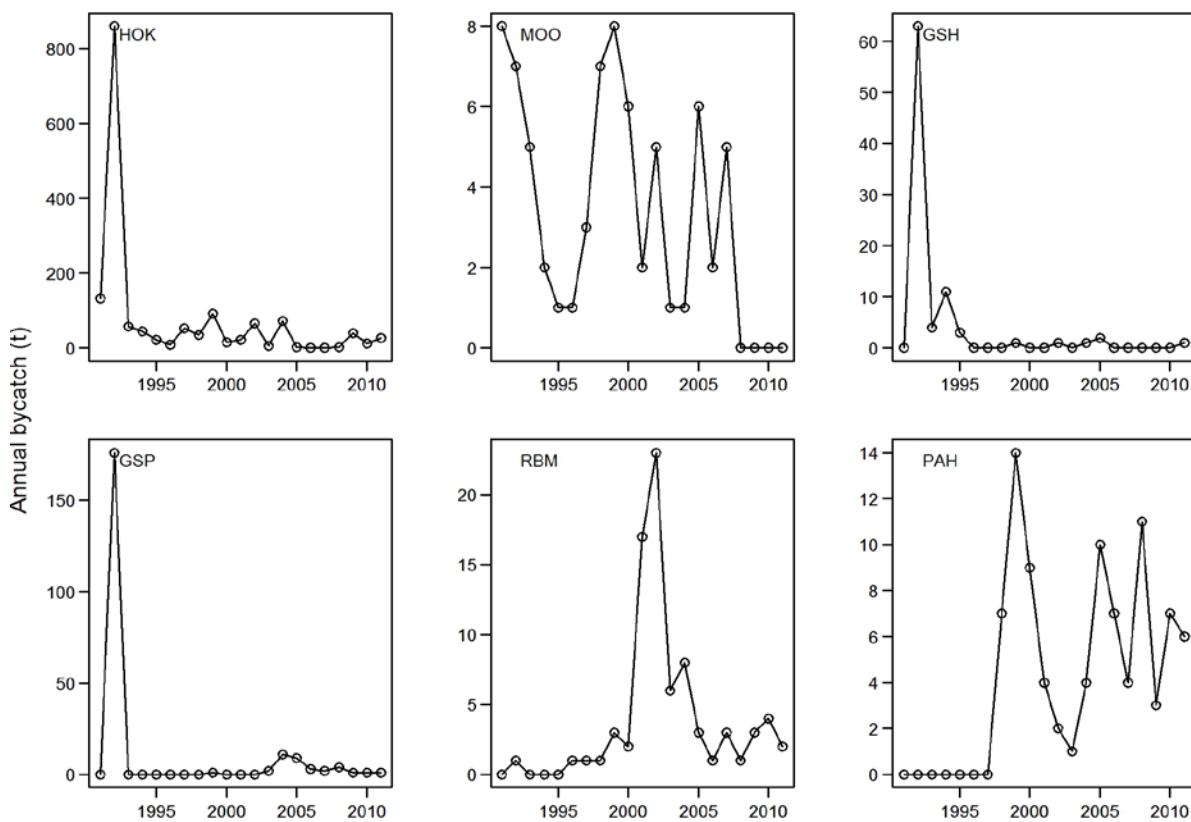

- The most commonly caught bycatch species were barracouta (*Thyrsites atun*, BAR), silver warehou (*Seriolella punctata*, SWA), and spiny dogfish (*Squalus acanthias*, SPD).
- Of the 101 bycatch species examined, 15 have shown a decrease in catch over time and 54 an increase in catch.
- The species showing the greatest decline were paddle crabs (PAD), jack mackerels (*Trachurus* spp., JMA), and slender jack mackerel (*Trachurus murphyi*, JMM) (Figure 1).
- The species showing the greatest increase were giant spider crab (*Jacquinotia edwardsii*, GSC), smooth red swimming crab (NCB), and silver dory (*Cyttus novaezealandiae*, SDO) (Figure 1).

**Figure 1:** Annual bycatch estimates in the arrow squid trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2010–11. See text above for explanation of the species codes.

## Southern blue whiting trawl fishery

- The most commonly caught bycatch species were ling (*Genypterus blacodes*, LIN), hoki (*Macruronus novaezelandiae*, HOK), and hake (*Merluccius australis*, HAK).
- Of the 65 bycatch species examined, 12 have shown a decrease in catch over time and 4 an increase in catch.
- The species showing the greatest decline were hoki (HOK), moonfish (*Lampris guttatus*, MOO) and dark ghost shark (*Hydrolagus novaezealandiae*, GSH) (Figure 2).
- The species showing the greatest increase were pale ghost shark (*Hydrolagus bemisi*, GSP), ray's bream (*Brama brama*, RBM) and opah (*Lampris immaculatus*, PAH) (Figure 2).

**Figure 2:** Annual bycatch estimates in the southern blue whiting trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2010–11. See text above for explanation of the species codes.

## Scampi trawl fishery

- The most commonly caught bycatch species were javelinfish (*Lepidorhynchus denticulatus*, JAV), unspecified rattails (Macrouridae, RAT), and sea perch (*Helicolenus* spp., SPE).
- Of the 250 bycatch species examined, 49 have shown a decrease in catch over time and 59 an increase in catch.
- The species showing the greatest decline were skates (Rajidae and Arhynchobatidae, SKA), bluenose (*Hyperoglyphe antarctica*, BNS) and alfonsino (*Beryx* spp., BYX) (Figure 3).
- The species showing the greatest increase were common roughy (*Paratrachichthys trrailli*, RHY), jackknife prawn (*Haliporoides sibogae*, HIS), and spiny masking crab (*Teratomaia richardsoni*, SMK) (Figure 3).

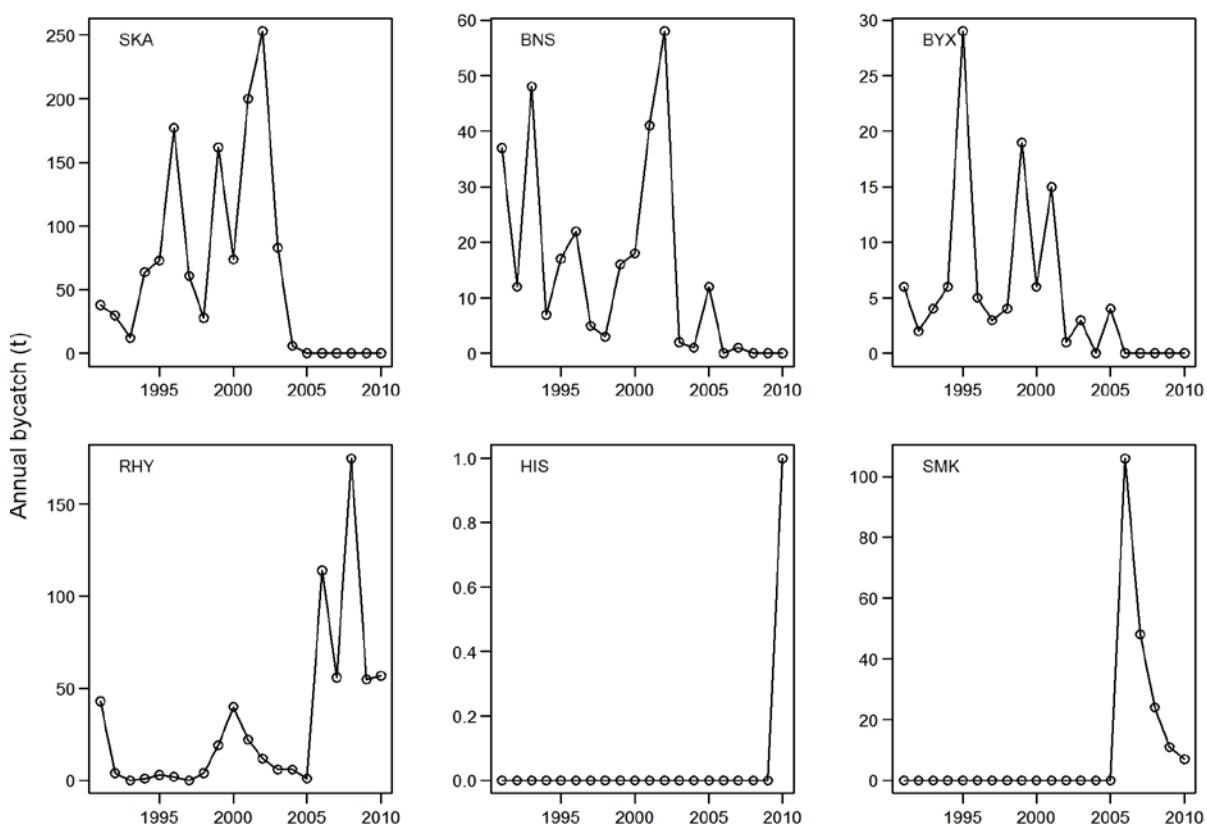

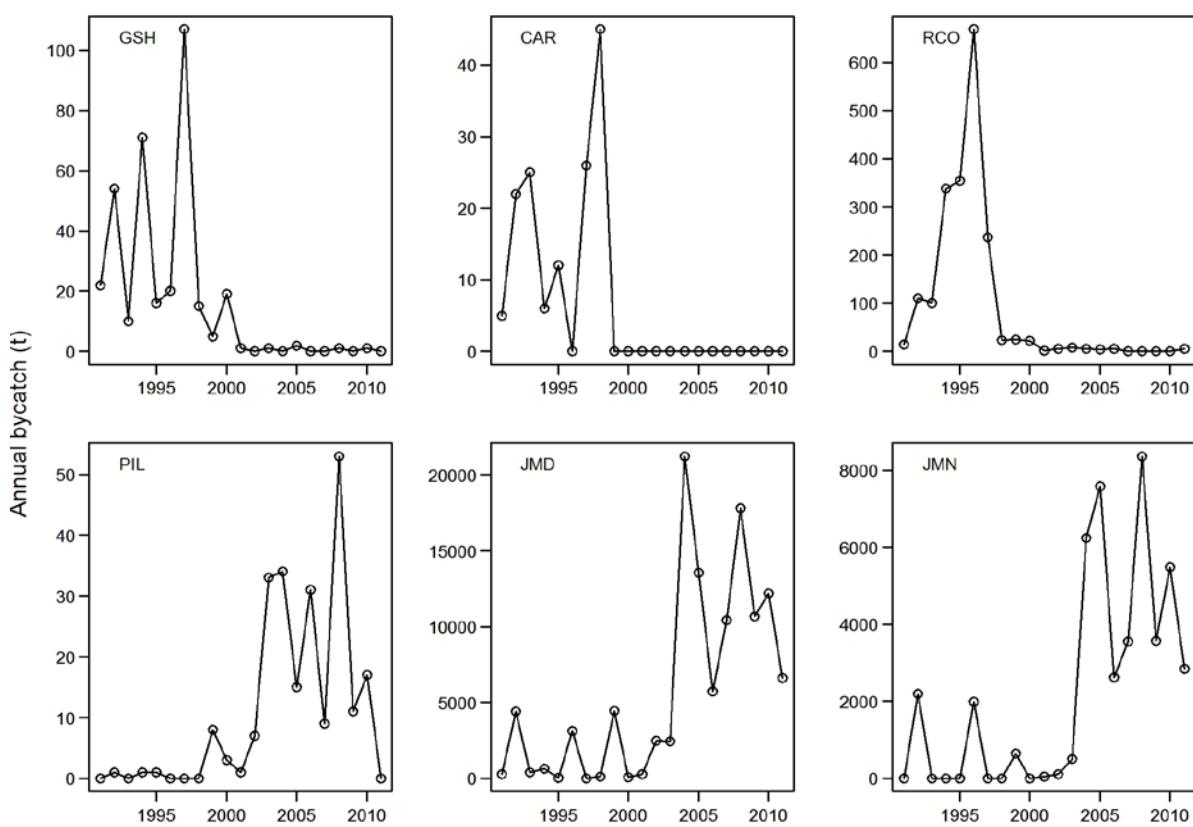

Figure 3: Annual bycatch estimates in the scampi trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2010–11. See text above for explanation of the species codes.

## Jack mackerel trawl fishery

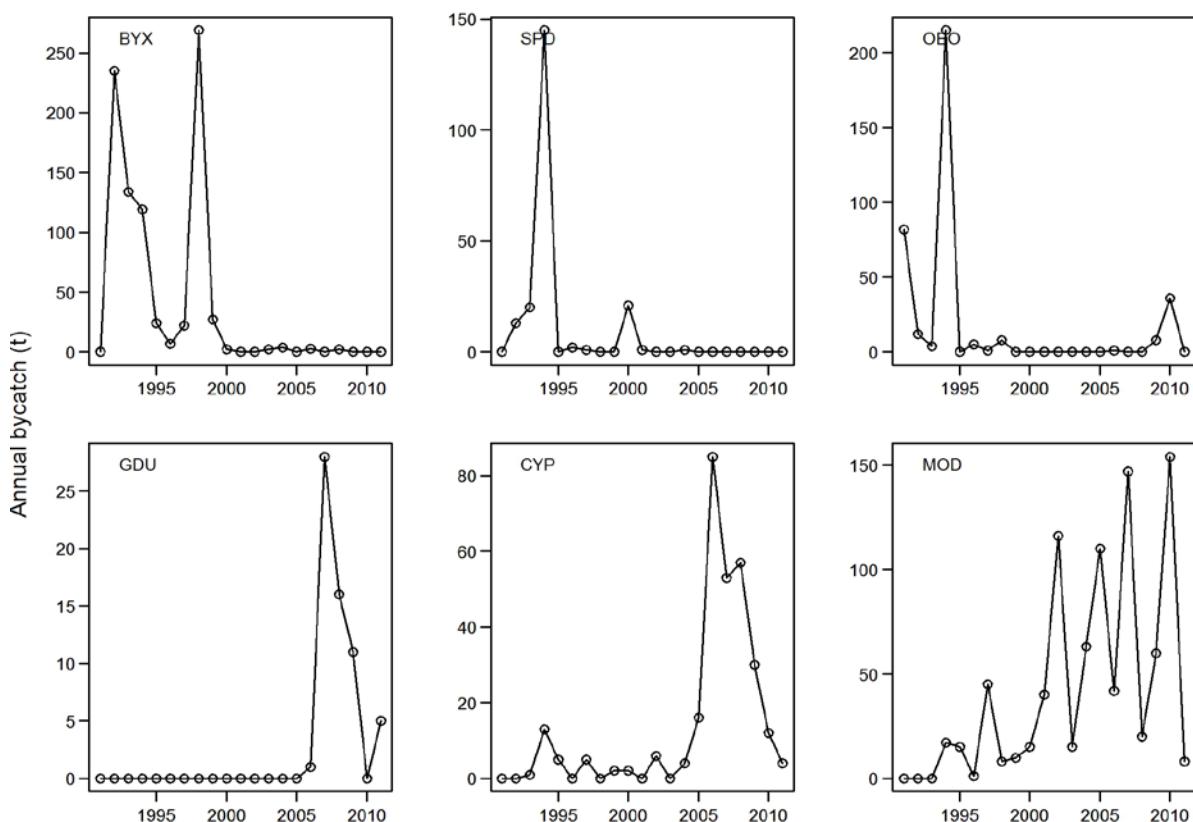

- The most commonly caught bycatch species were barracouta (BAR), blue mackerel (*Scomber australasicus*, EMA), and frostfish (*Lepidopus caudatus*, FRO).
- Of the 114 bycatch species examined, 32 have shown a decrease in catch over time and 18 an increase in catch.
- The species showing the greatest decline were dark ghost shark (GSH), carpet shark (*Cephaloscyllium isabellum*, CAR), and red cod (*Pseudophycis bachus*, RCO) (Figure 4).
- The species showing the greatest increase were pilchard (*Sardinops sagax*, PIL), greenback jack mackerel (*Trachurus declivis*, JMD), and yellowtail jack mackerel (*T. novaezelandiae*, JMN). Although part of the target species group, the latter two species are included to enable examination of changes in the relative catches of the constituent species under the JMA code. (Figure 4).

**Figure 4: Annual bycatch estimates in the jack mackerel trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2010–11. See text above for explanation of the species codes.**

## Orange roughy trawl fishery

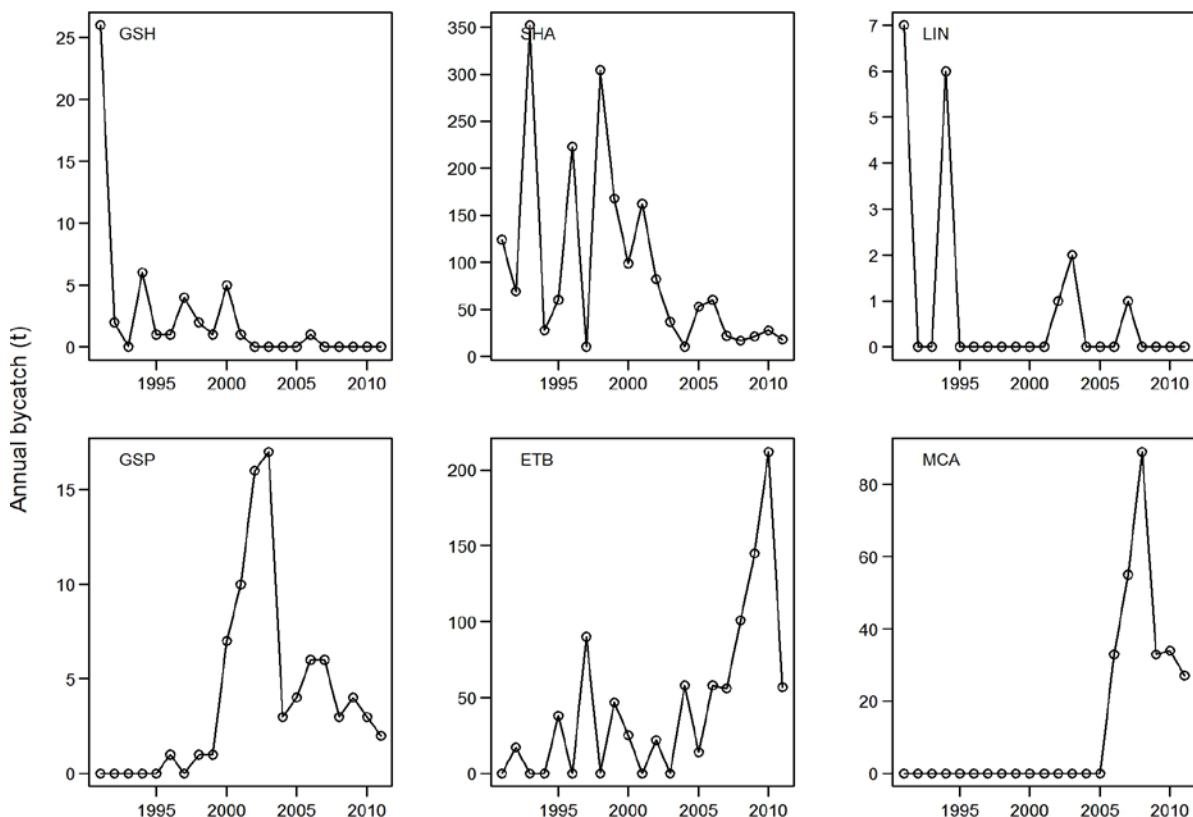

- The most commonly caught bycatch species were smooth oreo (*Pseudocyttus maculatus*, SSO), black oreo (*Allocyttus niger*, BOE), and black cardinalfish (*Epigonus telescopus*, CDL).
- Of the 206 bycatch species examined, 29 have shown a decrease in catch over time and 51 an increase in catch.
- The species showing the greatest decline were alfonsino (BYX), spiny dogfish (SPD), and oreos (Oreosomatidae, OEO) (Figure 5).
- The species showing the greatest increase were bushy hard coral (*Goniocorella dumosa*, GDU), longnose velvet dogfish (*Centroscymnus crepidater*, CYP), and morid cods (Moridae, MOD) (Figure 5).

**Figure 5:** Annual bycatch estimates in the orange roughy trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2010–11. See text above for explanation of the species codes.

## Oreo trawl fishery

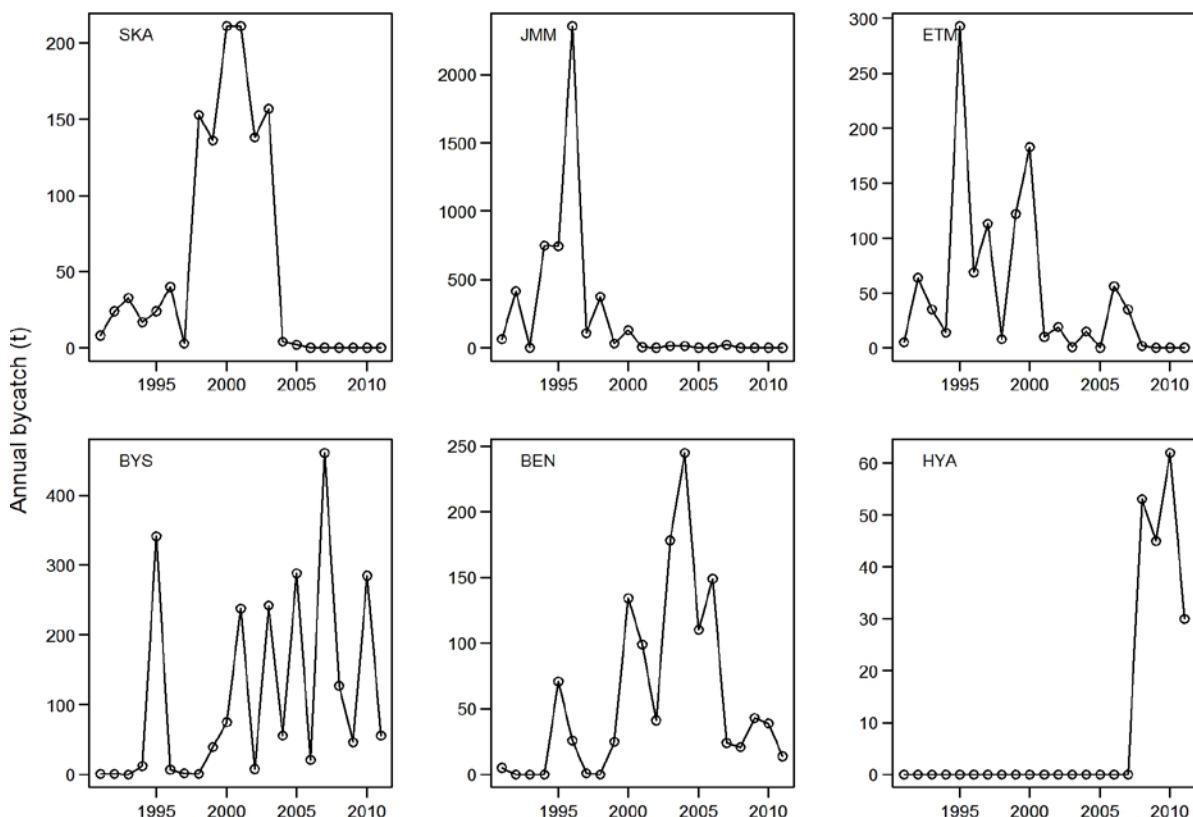

- The most commonly caught bycatch species were orange roughy (*Hoplostethus atlanticus*, ORH), unspecified shark (SHA), and hoki (HOK).
- Of the 110 bycatch species examined, 3 have shown a decrease in catch over time and 27 an increase in catch.
- The species showing the greatest decline were dark ghost shark (GSH), unspecified shark (SHA), and ling (LIN) (Figure 6).
- The species showing the greatest increase were pale ghost shark (GSP), Baxter's lantern dogfish (*Etomopterus baxteri*, ETB), and ridge-scaled rattail (*Macrourus carinatus*, MCA) (Figure 6).

**Figure 6:** Annual bycatch estimates in the oreo trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2010–11. See text above for explanation of the species codes.

## Hoki, hake, ling trawl fishery

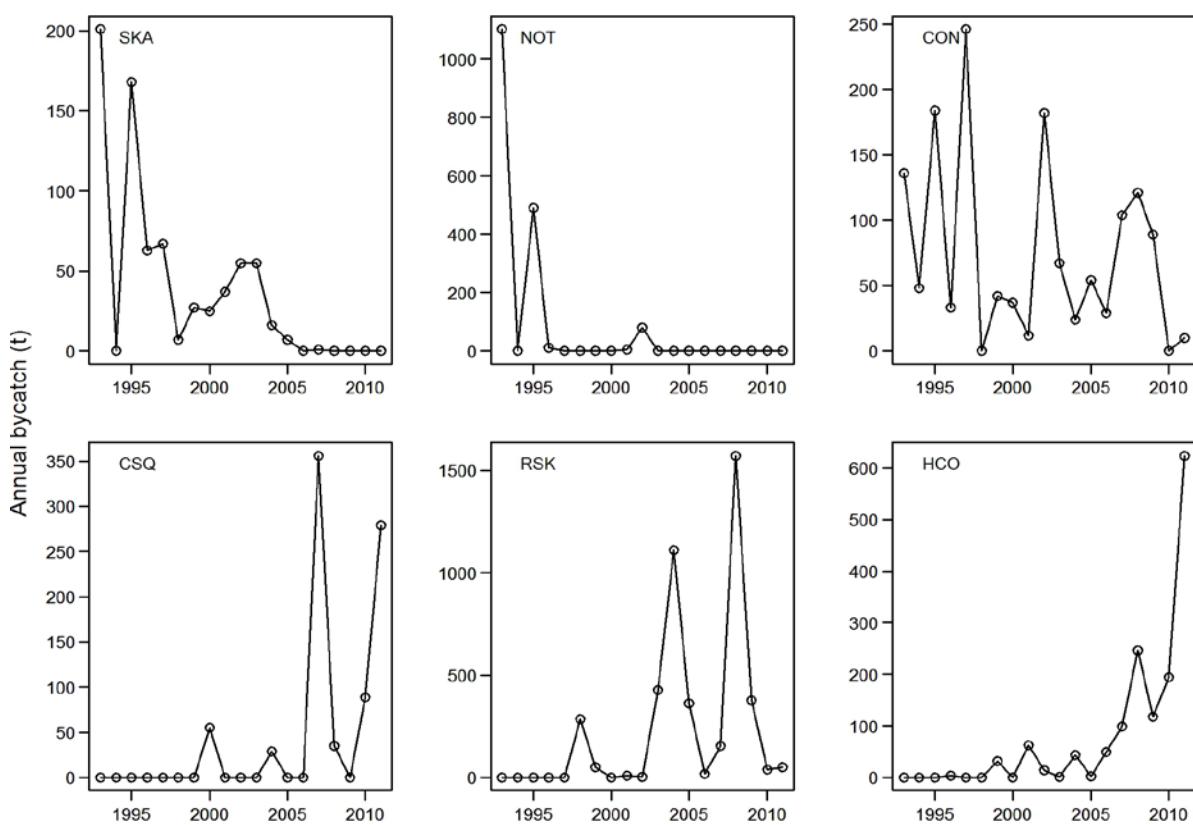

- The most commonly caught bycatch species were silver warehou (SWA), javelinfish (JAV), unspecified rattails (Macrouridae, RAT).
- Of the 342 bycatch species examined, 44 have shown a decrease in catch over time and 102 an increase in catch.
- The species showing the greatest decline were skates (SKA), slender jack mackerel (JMM), and dogfishes (*Etmopterus* spp., ETM) (Figure 7).
- The species showing the greatest increase were alfonsino (*Beryx splendens*, BYS), scabbardfish (*Benthodesmus* spp., BEN), and floppy tubular sponge (*Hyalascus* sp., HYA) (Figure 7).

**Figure 7:** Annual bycatch estimates in the hoki, hake, and ling trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2010–11. See text above for explanation of the species codes.

## Ling longline fishery

- The most commonly caught bycatch species were spiny dogfish (SPD), ribaldo (*Mora moro*, RIB), and smooth skate (*Dipturus innominatus*, SSK).
- Of the 103 bycatch species examined, 5 have shown a decrease in catch over time and 35 an increase in catch.
- The species showing the greatest decline were skates (SKA), Antarctic rock cods (Nototheniidae, NOT), and conger eels (*Conger* spp., CON) (Figure 8).
- The species showing the greatest increase were leafscale gulper shark (*Centrophorus squamosus*, CSQ), rough skate (*Zearaja nasuta*, RSK), and hairy conger (*Bassanago hirsutus*, HCO) (Figure 8).

**Figure 8:** Annual bycatch estimates in the ling longline fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2010–11. See text above for explanation of the species codes.

In order to examine temporal trends for individual species or species groups across all eight fisheries, a summary of the slope coefficients for each species and fishery is provided in graphical form in Table 9. This shows a consistent increase (in six or more of the eight fisheries) for starfish (Asteroidea), deepsea skates (*Notoraja* spp.), Baxters lantern dogfish (*Etmopterus baxteri*), Lucifer dogfish (*E. lucifer*), lanternfish (Myctophidae), rough skate (*Zearaja nasuta*), pale ghost shark (*Hydrolagus bemisi*), and javelinfish (*Lepidorhynchus denticulatus*); and consistent declines for bluenose (*Hyperoglyphe Antarctica*), shark (unspecified), and skates (Rajidae and Arhynchobatidae).

#### **4. ACKNOWLEDGMENTS**

Thanks to Jim Roberts (NIWA) for his review of this report, and to Richard Ford (MPI) for his useful suggestions for enhancing the utility of the report. This project was funded by the Ministry for Primary Industries (Project DAE2010/02).

**Table 4: Oreo trawl fishery. Total annual bycatch estimates (t) for individual species with at least 1 t of bycatch in at least one year, based on observer catch rates; blank cells less than 1 t. Species are ordered by decreasing total catch. The slope of a regression through the data points is shown in parentheses alongside each species code (see <http://marlin.niwa.co.nz> for species code definitions).**

**Table 4—continued**

**Table 5: Orange roughy trawl fishery. Total annual bycatch estimates (t) for individual species with at least 1 t of bycatch in at least one year, based on observer catch rates; blank cells less than 1 t. Species are ordered by decreasing total catch. The slope of a regression through the data points is shown in parentheses alongside each species code (see <http://marlin.niwa.co.nz> for species code definitions).**

Total annual bycatch estimates (t) for individual species with at least 1 t of bycatch in at least one year, based on observer catch rates; blank cells less than 1 t. Species are ordered by decreasing total catch. The slope of a regression through the data points is shown in parentheses alongside each species code (see <http://marlin.niwa.co.nz> for species code definitions).**

**Table 8: Ling longline fishery. Total annual bycatch estimates (t) for individual species with at least 1 t of bycatch in at least one year, based on observer catch rates; blank cells less than 1 t. Species are ordered by decreasing total catch. The slope of a regression through the data points is shown in parentheses alongside each species code (see <http://marlin.niwa.co.nz> for species code definitions).**
